Study description

This study is intended to further explore the metabolic reactions which appear in patients treated with antipsychotic medications, particularly weight gain. The genetic basis of these reactions are a focus of attention, at this regard, a blood

sample is taken from each recruited patient.

Methodological aspects

Study type

Study type list

Study type:

Non-interventional study

Scope of the study:

Assessment of risk minimisation measure implementation or effectiveness

Drug utilisation

Effectiveness study (incl. comparative)

Main study objective:

To identify some of the genetic polymorphisms related to weight gain in patients treated with antipsychotics. Other objectives are, to further learn and characterize other adverse reactions, the effectiveness of these medications and the way they are being used in a real setting, finally, an intervention to optimize the use of this medication is foreseen.

Study Design

Non-interventional study design

Population studied

Age groups

- Adolescents (12 to < 18 years)
 - Adults (18 to < 46 years)
 - Adults (46 to < 65 years)
 - Adults (65 to < 75 years)
 - Adults (75 to < 85 years)
 - Adults (85 years and over)
-

Estimated number of subjects

425

Study design details

Outcomes

Weight gain > 7% of initial weight at baseline
