Treatment patterns and clinical effectiveness outcomes of palbociclib in combination with aromatase inhibitor (AI) or fulvestrant in hormone receptor positive (HR+)/human epidermal growth factor receptor 2 negative (HER2-) advanced or metastatic breast cancer patients: an observational study using Flatiron Electronic Health Record (EHR) database

Study description

This is an observational study using de-identified EHR data from Flatiron Health Analytic Database. The main objective is to describe patient demographics, clinical characteristics, treatment patterns and clinical effectiveness outcomes in a cohort of HR+/HER2- breast cancer patients who initiated palbociclib (Ibrance®) in combination with an AI or fulvestrant for treatment of advanced or metastatic disease, using flatiron HER database. The study population includes adult patients diagnosed with breast cancer identified from FI database between 01 January 2011 and 30 June 2017 (defined as “study period”) and who initiated palbociclib for treatment of advanced or metastatic disease on or after 03 February 2015. Information on patient demographics, clinical characteristics, treatment characteristics, CBC monitoring patterns and clinical effectiveness outcomes will be identified.

Breast cancer

Population studied

Age groups

Adults (18 to < 46 years)

Adults (46 to < 65 years)

Adults (65 to < 75 years)

Adults (75 to < 85 years)

Adults (85 years and over)

Estimated number of subjects

500

Study design details

Outcomes

Patient demographics, clinical characteristics, treatment patterns, effectivness outcomes

---

Data analysis plan

All analyses will be descriptive in nature and no statistical tests of hypotheses will be performed. Patient demographics, clinical characteristics and/or treatment patterns will be presented for all patients and will be explored by line of therapy (provided data are sufficient). Descriptive statistics will be reported for continuous variables (eg, age, time from initial breast cancer diagnosis to metastatic diagnosis) using the mean, median, 25th and 75th quantiles, minimum, maximum, and standard deviation. Categorical variables (eg, region, stage at initial diagnosis) will be reported using frequencies and proportions. The calculation of percentages will always include the missing category in the case of missing values. Counts of missing observations will thus be included in the denominator and presented as a separate category. Kaplan-Meier figures will be generated for “time to” variables and related statistics will be reported.
