Study description

The main objective of the proposed study is to compare selected CV effectiveness outcomes in patients with T2DM initiating empagliflozin compared to propensity score (PS) matched patients with T2DM initiating a DPP-4 inhibitor in sequential analyses within periodically updated cohorts in the U.S., secondary objectives include other effectiveness outcomes, safety outcomes, and healthcare utilization outcomes.

Methodological aspects

Study type

Study type list

Study type:

Non-interventional study

Scope of the study:

Effectiveness study (incl. comparative)

Safety study (incl. comparative)

Main study objective:

To compare selected CV effectiveness outcomes in patients with T2DM initiating empagliflozin compared to propensity score (PS) matched patients with T2DM initiating a DPP-4 inhibitor in sequential analyses within periodically updated cohorts in the U.S. secondary objectives include other effectiveness outcomes, safety outcomes, and healthcare utilization outcomes.

Study Design

Non-interventional study design

Cohort

Other

Non-interventional study design, other

Sequential matched cohort study

Study drug and medical condition

Study drug International non-proprietary name (INN) or common name

EMPAGLIFLOZIN

SITAGLIPTIN

SAXAGLIPTIN

LINAGLIPTIN

ALOGLIPTIN

Medical condition to be studied

Type 2 diabetes mellitus

Population studied

Age groups

- Adults (18 to < 46 years)
- Adults (46 to < 65 years)
- Adults (65 to < 75 years)
- Adults (75 to < 85 years)
- Adults (85 years and over)

Estimated number of subjects

232000

Study design details

Outcomes

- 3-point MACE hospital admission for MI, hospital admission for stroke, CV mortality and its individual components- hospital admission for HF- all-cause mortality, - Coronary revascularization procedure - End-stage renal disease - Initiation of laser treatment for retinopathy- Bone fracture- Diabetic ketoacidosis- Severe hypoglycemia- All urinary tract cancers and its individual components, additional cancers may be considered.- Lower-limb amputation- Acute kidney injury requiring dialysis- Healthcare resource utilization- Cost

---

Data analysis plan

We will receive new data as they become available on a periodic basis (every 12 months) and, at each data cut, we will update the original set of data, form sequential cohorts by propensity score (PS) matching within 12-month blocks of time, follow patients for each of the outcomes of interest in a prospective manner, and estimate measures of effect using person-time based analyses among patients who initiate empagliflozin versus DPP-4 inhibitor use. Unadjusted and adjusted relative risks (hazard ratios) and rate differences will be estimated. In adjusted analyses, we will use propensity score (PS) matching to balance potential confounders.

Data management

ENCePP Seal

The use of the ENCePP Seal has been discontinued since February 2025. The ENCePP Seal fields are retained in the display mode for transparency but are no longer maintained.
