Study description

Primary objective is to document the safety and tolerability of wilate® for prophylaxis and treatment of bleeding in VWD, incl. surgeriesSecondary objective is to document the efficacy of wilate® in the treatment of acute bleeding, in the prophylaxis of VWD and in interventional procedures (e.g. minor/major surgery, dental care, invasive diagn. proced. etc.).Population:VWD patients of any gender, age, or VWD type, previously treated (PTPs) or previously untreated patients (PUPs).Investigational and reference therapy:wilate® - human coagulation factor VIII and human von Willebrand factor (VWF)Design:Open-label, prospective, multicentre, multinational, post-marketing, observational, non-interventional surveillanceEfficacy assessments:Assessment of efficacy of wilate® in prevention and/or treatment of bleeding episodes and in surgical procedures will be based on a 4-point hemostatic efficacy scale as “excellent”, “good” “moderate” or “none”. The frequency of bleeding episodes in total and per bleeding site, days of treatment of bleeding episodes in total and per bleeding site, exposure days and consumption of wilate® per event, per patient and in total will be calculated.Safety/Tolerability assessments:Assessment of safety will be based on recorded Adverse Drug Reactions during the full course of the observation. Assessment of tolerability will be based on a 3 point Verbal Rating Scale.As recomm. assessment, this study will observe development of inhibitors against VWF in response to wilate® treatment (ELISA). Inhibitor assessment should be

performed before and after first wilate® application, and then the every 3 months.As recomm. assessment, study will observe the coagulation parameters based on assessment of prothrombin fragment 1 and 2 (F1+2) and D-dimer (DD) by latex enhanced immunoturbimetric test. Thrombogenicity assessment should be performed before first wilate® application, 1 hour, 3 and 24 hours after application and every 3 months

Wilate - B02BD06

Medical condition to be studied

Von Willebrand's disease

Population studied

Short description of the study population

von Willebrand disease (VWD) patients of any gender, age, or VWD type, previously treated (PTPs) or previously untreated patients (PUPs).

Age groups

- Preterm newborn infants (0 – 27 days)
- Term newborn infants (0 – 27 days)
- Infants and toddlers (28 days – 23 months)
- Children (2 to < 12 years)
- Adolescents (12 to < 18 years)
- Adults (18 to < 46 years)
- Adults (46 to < 65 years)
- Adults (65 to < 75 years)
- Adults (75 to < 85 years)
- Adults (85 years and over)

Special population of interest

Other

Special population of interest, other

von Willebrand disease (VWD) patients

Estimated number of subjects

50

Study design details

Outcomes

Assessment of safety will be based on recorded Adverse Drug Reactions during the full course of the observation. Assessment of tolerability will be based on a 3 point Verbal Rating Scale. Assessment of efficacy of wilate® in prevention and/or treatment of bleeding episodes and in surgical procedures will be based on a 4-point hemostatic efficacy scale as “excellent”, “good” “moderate” or

“none”.

Data analysis plan

The responsibility for the statistical analyses presented in the final report belongs to: contract research organisation: GASD, Gesellschaft für Angewandte Statistik + Datenanalyse mbH, Am Konvent 8 - 10, 41460 Neuss, Germany.This is a prospective post-licensure surveillance that will be conducted as an international multi-centre non-interventional surveillance. All items of the CRF will be analyzed by means of descriptive statistical methods.

Data management

ENCePP Seal

The use of the ENCePP Seal has been discontinued since February 2025. The ENCePP Seal fields are retained in the display mode for transparency but are no longer maintained.
