Study description

Meta-analysis of interventional and non-interventional studies that investigated the association between thiazides and non-melanoma skin cancer and malignant melanoma in any population.

Regulatory

Was the study required by a regulatory body?

No

Is the study required by a Risk Management Plan (RMP)?

Not applicable

Methodological aspects

Study type

Study type list

Study topic:

Human medicinal product

Disease /health condition

Study type:

Non-interventional study

Scope of the study:

Assessment of risk minimisation measure implementation or effectiveness

Data collection methods:

Secondary use of data

Main study objective:

To quantify the association between the use of thiazides drugs and the risk of skin cancer

Study Design

Non-interventional study design

Systematic review and meta-analysis

Study drug and medical condition

Anatomical Therapeutic Chemical (ATC) code

(C03AA) Thiazides, plain

Thiazides, plain

Medical condition to be studied

Skin cancer

Skin cancer metastatic

Population studied

Short description of the study population

Subjects with non-melanoma skin cancer (NMSC) and malignant melanoma (MM) identified from the interventional and non-interventional studies received treatment with any thiazide diuretic, single or in combination, at class level or substance level.

Age groups

Adults (18 to < 46 years)

Adults (46 to < 65 years)

Adults (65 to < 75 years)

Adults (75 to < 85 years)

Adults (85 years and over)

Special population of interest

Other

Special population of interest, other

Malignant melanoma patients

Estimated number of subjects

100000

Study design details

Outcomes

Skin cancer

Data analysis plan

A search in Medline and Embase was conducted in order to identify interventional and non-interventional studies that investigated the association between thiazides and NMSC or MM in any population
