An Observational Post-authorization Safety Specialist Cohort Event Monitoring Study (SCEM) to Monitor the Safety and Utilization of rivaroxaban (XARELTO®) initiated in secondary care for the prevention of atherothrombotic events in patients who have had acute coronary syndrome in England and Wales (ROSE ACS)

#### Study description

Rivaroxaban is a medicine which reduces the formation of blood clots. Acute coronary syndrome (ACS) comprises a range of disorders, including heart attack and unstable angina, caused by a sudden reduction in blood flow to part of the heart muscle. This study aims to collect information on the use of rivaroxaban and its safety when used by patients for the prevention of artherothrombotic (plaque rupture leading to a blood clot) events following ACS, during the first three months after starting. This study was requested by the European regulatory body (EMA) which is responsible for the use and safety of medicines. It will last for approximately 3 years and is a national study covering the whole of England and Wales. The study aims to recruit 1193 patients who have been prescribed rivaroxaban and antiplatelet therapy and 1193 patients who have been prescribed alternative dual antiplatelet therapy for the secondary prevention of artherothrombotic events following ACS. Each patient will only be monitored for the first 13 weeks after hospital admission for ACS. Patients who choose to take part will complete a consent form. The patient's care team will be asked to complete a baseline questionnaire about the patient at the time the medicine is given and a further questionnaire up to 16 weeks later, specifically asking about the patient's experiences whilst on the medication. If anything unusual is reported during the observation period, the care team may be asked to fill out a followup questionnaire. With the patient's consent, the study team will also inform the patient's GP of their participation in the study and will ask the GP to complete an abridged questionnaire from the patient's medical records. The study team will analyse and aggregate the data, carefully protecting patient confidentiality, to classify adverse events of interest, in

# Sources of funding

• Pharmaceutical company and other private sector

# More details on funding

Bayer Pharma AG

# Study protocol

ACS SCEM Final\_30\_08\_2017\_version 7\_Clean.pdf (846.95 KB)

# Regulatory

Was the study required by a regulatory body?

Yes

Is the study required by a Risk Management Plan (RMP)?

EU RMP category 1 (imposed as condition of marketing authorisation)

# Methodological aspects

Study type

Study type list

Study topic:

Human medicinal product

#### Study type:

Non-interventional study

### Scope of the study:

Drug utilisation

Safety study (incl. comparative)

#### **Data collection methods:**

Secondary use of data

#### Main study objective:

1. To quantify the cumulative incidence (risk and rate) of haemorrhage (major bleeding within intracranial, gastrointestinal and urogenital organ sites) occurring in the 12 week observation period

# Study Design

### Non-interventional study design

Cohort

# Study drug and medical condition

Study drug International non-proprietary name (INN) or common name RIVAROXABAN

# Population studied

Short description of the study population

Patients in the secondary care hospital setting in England and Wales.

This study will be a prospective observational, population-based cohort study of rivaroxaban with a contextual comparator (reference cohort). The rivaroxaban cohort consists of new rivaroxaban users (no anticoagulant prescription within 6 months prior to index date) with any combination of oral antiplatelet therapy for the prevention of atherothrombotic events following ACS. The contextual cohort consists of patients receiving the current standard treatment of care for the prevention of atherothrombotic events following an ACS (at least dual antiplatelet therapy, but not monotherapy).

#### Age groups

- Adults (18 to < 46 years)
- Adults (46 to < 65 years)
- Adults (65 to < 75 years)
- Adults (75 to < 85 years)
- Adults (85 years and over)

### **Estimated number of subjects**

2386

# Study design details

#### **Outcomes**

Intracranial, gastrointestinal or urogenital major bleeding.

### Data analysis plan

- quantify the cumulative incidence (risk and rate) of major bleeding - descriptive exploratory analysis of patient population prescribed rivaroxaban-quantify the risk of other major (in any other site not specified in the primary objective) or minor bleeding outcomes (in any site) reported in the 12 week
