Our aim is to investigate similarity-based approaches to identify the risk of a patient having an asthma attack in the 1 year following an asthma review appointment in primary care. We will use primary care electronic health records to derive this model. The two similarity-based approaches that we will investigate are a neighbourhood approach (i.e. identifying the patients who are most similar to the patient of interest and training the model only on these patients) and a cluster approach (i.e. identifying groups of similar patients via cluster analysis and training a separate model for each group). The variables that we will use to quantify similarity and derive the risk score will be chosen based on similar risk-prediction studies in asthma.

# Study timelines

Date when funding contract was signed

Planned: 18/08/2020

### Study start date

Planned: 18/08/2020

### Data analysis start date

Planned: 18/08/2020

### Date of interim report, if expected

Planned: 30/06/2021

### **Date of final study report**

Planned: 31/12/2021

# Sources of funding

Other

# More details on funding

MRC (via PhD studentship)

# Regulatory

Was the study required by a regulatory body?

No

### Is the study required by a Risk Management Plan (RMP)?

Not applicable

# Methodological aspects

# Study type

Study type list

### Study type:

Non-interventional study

### Scope of the study:

Disease epidemiology

### Main study objective:

To investigate similarity-based approaches to identifying the risk of asthma attack in the year following an asthma review appointment in primary care.

# Study Design

### Non-interventional study design

Cohort

# Study drug and medical condition

### Medical condition to be studied

**Asthma** 

# Population studied

### Age groups

Adults (18 to < 46 years)

Adults (46 to < 65 years)

Adults (65 to < 75 years)

Adults (75 to < 85 years)

Adults (85 years and over)

### **Estimated number of subjects**

500000

# Study design details

### **Outcomes**

risk of asthma attack in following 1 year

### Data analysis plan

The primary analysis will be carried out using data from OPCRD. The approach used in OPCRD will be externally validated using data from the SAIL databank. Methods of analysis are summarise below: Traditional approach: We will use methods such as logistic regression to derive a score corresponding to the risk of asthma attack in the following year. Similarity-based approaches: We will use metrics such as the Euclidean distance to quantify the similarity between patients. We will then use this metric to identify a subsample using both a neighbourhood approach (i.e. all patients within a specified similarity threshold) and a cluster approach (i.e. identify subsamples using cluster analysis). We will use methods such as logistic regression to derive a risk prediction model from the identified subsample.
