### Study description

Beyond the psycho-social consequences of the coronavirus disease 2019 (COVID-19) pandemic, people with severe mental disorders, such as schizophrenia and bipolar disorder have been reported with an up to 2-fold increased 30-days risk of death after a severe acute respiratory syndrome coronavirus 2 (SARS-Cov-2) positive test. Recent use of psychotropic agents has also been associated with increased risk of death, varying between 50% in users of antidepressants to a three-fold increase in users of antipsychotics. The importance of maintaining and adjusting pharmacological treatment of people with severe mental disorders during the COVID-19 pandemic has been emphasized. Identifying those drugs with lower risk profiles regarding adverse outcomes to COVID-19 will support guidance of selecting and adjusting acute and maintenance treatment during the COVID-19 pandemic. The present study aims at providing a population-based description of the association and potential differential impact of frequently used psychotropic drugs on the course and outcomes of COVID-19 in people with hospital diagnosed and without hospital diagnosed psychiatric disorders. We hypothesize that psychotropic treatment patterns differ between community-treated COVID-19 patients and hospitalized or deceased COVID-19 patients with lower risks for unfavourable outcomes in users of a) aripiprazole, haloperidol, risperidone or paliperidone as oral or short-acting injectable antipsychotics vs. other oral or depot long-acting antipsychotics, b) short-acting benzodiazepines vs. long-acting benzodiazepines, c) SSRIs vs. tricyclic antidepressants. We will use data from the prospectively collected Danish COVID-19 cohort at Statens Serum Institut including all Danish residents tested by the reverse transcriptase polymerase chain reactions (RT-PCR) for SARS-CoV-2.

## Methodological aspects

### Study type

### Study type list

**Study type:**

Non-interventional study

---

**Scope of the study:**

Assessment of risk minimisation measure implementation or effectiveness

Drug utilisation

**Main study objective:**

To provide a population-based description of the association and potential differential impact of frequently used psychotropic drugs on the course and outcomes of COVID-19 in people with hospital diagnosed and without hospital diagnosed psychiatric disorders.

## Study Design

**Non-interventional study design**

Cohort

**Medical condition to be studied**

SARS-CoV-2 test positive

## Population studied

## **Age groups**

- Preterm newborn infants (0 – 27 days)
  - Term newborn infants (0 – 27 days)
  - Infants and toddlers (28 days – 23 months)
  - Children (2 to < 12 years)
  - Adolescents (12 to < 18 years)
  - Adults (18 to < 46 years)
  - Adults (46 to < 65 years)
  - Adults (65 to < 75 years)
  - Adults (75 to < 85 years)
  - Adults (85 years and over)
- 

## **Special population of interest**

Renal impaired

Hepatic impaired

Immunocompromised

Pregnant women

---

## **Estimated number of subjects**

25000

# **Study design details**

## **Outcomes**

Hospitalization within 14 days and death within -2 to 30 days since the verified positive test, (Among those hospitalized): Length of hospitalization, ICU treatment and ventilation (-2 days before the index date).

---

## **Data analysis plan**

We will describe the prevalence of specific drug use within 6 months before testing for community treated, hospitalized and deceased patients, stratified by age, sex and psychiatric comorbidity. In the primary analyses, we will investigate the association between cumulative and current psychotropic drug use prior to testing and risk of hospitalization and death using logistic regression analysis among all positively tested individuals. The analyses will be stratified, following clinical and power considerations, by psychiatric diagnoses (any diagnosis) and by individual psychiatric disorders. PS methodology will be applied by either matching or adjustment for each drug-outcome association of the respective drug pairs. We will apply formal testing for interactions between psychiatric diagnoses/hospital contacts and psychotropic drug use. We will report crude and adjusted odds ratios (ORs) and 95% confidence intervals (95% CI).

## Data management

### ENCePP Seal

The use of the ENCePP Seal has been discontinued since February 2025. The ENCePP Seal fields are retained in the display mode for transparency but are no longer maintained.
