Study description

Glasdegib (GLAS) and venetoclax (VEN) were approved in November 2018 for the treatment of AML in patients who are 75 years old or older or who have comorbidities that preclude intensive induction chemotherapy. Limited real-world observational studies of treatment patterns and outcomes for patients treated with either therapy have been conducted.

Methodological aspects

Study type

Study type list

Study topic:

Human medicinal product

Disease /health condition

Study type:

Non-interventional study

Scope of the study:

Drug utilisation

Effectiveness study (incl. comparative)

Other

If ‘other’, further details on the scope of the study

Treatment Patterns

Data collection methods:

Secondary use of data

Main study objective:

Understand patient demographic, clinical, and disease-related characteristics of AML patients who initiated treatment with GLAS-based regimen. Assess treatment patterns of AML patients who initiated treatment with GLAS-based regimen Estimate clinical outcomes of AML patients who initiated treatment with GLAS-based regimen.

Study Design

Non-interventional study design

Cohort

Study drug and medical condition

Name of medicine

DAURISMO

Medical condition to be studied

Acute myeloid leukaemia

Population studied

Short description of the study population

All patients treated by the providers with a GLAS-based regimen were identified during study feasibility. Unique identification numbers were then assigned to each patient. Cardinal Health randomized these patients and provided links to the eCRF in the random order they were sorted. Providers completed data abstraction sequentially according to the randomization order until all eligible patients were completed, or the provider was not able to perform data collection.

Inclusion criteria

Patients must have met all the following inclusion criteria to be eligible for inclusion in the study. Providers were asked to confirm the criteria are met by answering a set of questions in the patient eligibility portion of the eCRF which correspond to these criteria. Automatic date and logic checks were employed to ensure that a patient identified was eligible for the study.

For this study, the following inclusion criteria were used:

• Patients newly diagnosed with AML.

• Initiated 1L or later therapy (i.e., index therapy) for newly diagnosed AML with GLAS-based regimen or initiated 1L therapy with VEN-based regimen in the following time periods*

o Initiated 1L or later therapy for AML with GLAS-based regimen between 01 December 2018 and 31 December 2019.
o Initiated 1L therapy for AML with VEN-based regimen between 01 December 2018 and 31 December 2019.
• ≥18 years of age at index therapy initiation.
• ≥6 months of follow-up from initiation of index therapy unless died, with known date of death.
• Known cytogenetic risk profile at the time of index therapy.
• ≥1 bone marrow biopsy completed following index therapy initiation.

Exclusion criteria
Patients meeting any of the following criteria were not included in the study:
• Patients who received treatment for AML as part of a clinical trial.
• Patients with diagnosis of any other malignancy (except for non-melanoma skin cancer) at the time of treatment of AML.
o Patients with diagnosis of AML and non-melanoma skin cancer at the time of treatment of AML were not excluded.
• A patient with a record of 1 or more of the following confounding diagnoses at any time during data availability: acute lymphoblastic leukemia; acute promyelocytic leukemia, aggressive systemic mastocytosis; hypereosinophilic syndrome and/or chronic eosinophilic leukemia; dermatofibrosarcoma protuberans; or gastrointestinal stromal tumors.

Age groups
Adults (18 to < 46 years)
Adults (46 to < 65 years)
Adults (65 to < 75 years)
Adults (75 to < 85 years)
Adults (85 years and over)

Other

Special population of interest, other

Acute Myeloid Leukemia (AML) Patients

Estimated number of subjects

150

Study design details

Outcomes

Disease response, Transfusion independence (TI), event-free/relapse-free survival (EFS/RFS), and overall survival (OS) for AML patients treated with GLAS-based regimen

Data analysis plan

Each cohort will be described independently, no comparisons of patient characteristics or outcomes between GLAS- and VEN-treated patients will be conducted. The primary clinical outcomes of interest include TI, duration of therapy, disease response, duration of response, EFS, RFS, and OS. Time to event outcomes will be analyzed using the Kaplan-Meier method. Comparisons of time to event outcomes will be made using a Cox proportional hazards model or other parametric techniques as appropriate. Experience of toxicities will only be described for the VEN-treated cohort. Details of the data analysis will be provided in the statistical analysis plan.
