Study description

Approximately, 10-20% of pregnant women suffer from depression and 4-10% use selective serotonin reuptake inhibitor (SSRI) antidepressants at some stage during pregnancy. There is conflicting evidence regarding the risk of congenital anomalies and long-term neurodevelopmental outcomes such as autism spectrum disorder (ASD) and attention deficit hyperactivity disorder (ADHD) associated with in utero exposure to SSRI and serotonin and norepinephrine reuptake inhibitors (SNRI). Existing studies in the literature often lack the power to assess the effect of time varying confounders such as variation in maternal disease status, breastfeeding, and transient or chronic interactions with other medications on risk of adverse outcomes, and few examine other aspects of neurodevelopment. This study will help create evidence-based clinical guidelines on risks and benefits of antidepressant treatment in pregnancy. The objectives of this study are: 1) to develop algorithms to identify and validate maternal depression, neurodevelopmental outcomes and breastfeeding in healthcare data sources. 2) to describe patterns of SSRI/ SNRI antidepressant

use before, during, and after pregnancy and during lactation. This includes describing co-medication patterns, predictors of discontinuation, switching patterns, and trajectories of use over time. 3) to assess the association between in utero exposure to SSRI / SNRIs and neurodevelopmental outcomes. It will examine the potential additional impact of maternal depression, breastfeeding and concomitant exposure to P-glycoprotein (P-gp) or breast cancer resistance protein (BCRP) transporter inhibitors/substrates on neurodevelopmental outcomes in children. A second objective is to perform a EUROmediCAT safety study to assess the risk of major congenital anomalies associated with exposure to SSRI / SNRIs in the first trimester of pregnancy, and to evaluate the impact of co-medication with P-gp or BCRP transporter substrates on risk.

Is the study required by a Risk Management Plan (RMP)?

Not applicable

Methodological aspects

Study type

Study type list

Study type:

Non-interventional study

Scope of the study:

Drug utilisation

Safety study (incl. comparative)

Main study objective:

To assess the association between in utero exposure to SSRI / SNRIs and neurodevelopmental outcomes and major congenital anomalies

Study Design

Non-interventional study design

Case-control

Cohort

Study drug and medical condition

Anatomical Therapeutic Chemical (ATC) code

(N06A) ANTIDEPRESSANTS

ANTIDEPRESSANTS

Medical condition to be studied

Depression

Population studied

Age groups

- Preterm newborn infants (0 – 27 days)

- Term newborn infants (0 – 27 days)
- Infants and toddlers (28 days – 23 months)
- Children (2 to < 12 years)
- Adolescents (12 to < 18 years)

Special population of interest

Pregnant women

Estimated number of subjects

6000000

Study design details

Outcomes

Children with neurodevelopmental outcomes, Children with congenital anomalies

Data analysis plan

Each partner contributing to the study will run centrally produced analysis scripts on their own data, and upload aggregated results or effect estimates to the ConcePTION platform for meta-analyses by the postdoc researcher. Descriptive analysis: categorical variables will be summarized by frequencies and proportions of each modality, including the proportion of missing data. Mean, standard deviation and error, median and interquartile range will be provided for continuous variables. 95% Confidence intervals (CI) will be estimated using Normal approximation for quantitative relevant parameters. Cells with small numbers will be collapsed. We will conduct univariate and multivariate logistic, poisson, or linear regression and Cox proportional hazards regression on the data sources, based on an agreed SAP.

Data management

ENCePP Seal

The use of the ENCePP Seal has been discontinued since February 2025. The ENCePP Seal fields are retained in the display mode for transparency but are no longer maintained.
