Study description

This project will firstly evaluate diagnostic delay (DD) in patients with ulcerative colitis (UC). Then, we will explore the impact of DD on effectiveness and safety clinical outcomes. We will perform a retrospective cohort study. Data will be retrieved from the administrative healthcare databases of Tuscany, an Italian region. Patients will be included if they have a first record of ICD-9 diagnosis or co-payment exemption code of UC from June 1st, 2011 to December 31st, 2018 (index date, ID). Patients <18 years old at ID or with look-back period <5 years or follow-up period <2 years will be excluded. DD was defined by a record of emergency department (ED) access or hospitalization for gastrointestinal causes in the 7-60 months (7-18 months: short DD, 19-60 months: long DD) preceding ID. Patients with an ED access or hospitalization for gastrointestinal causes recorded in the 6 months before the ID or with none of these records were considered timely diagnosed (TD). We performed survival analyses (Kaplan-Meier curves) for effectiveness outcomes (time free from the first: dispensation of azathioprine, advanced therapy and surgery) and safety outcomes (time free from the first: ED access and/or hospitalization for any cause) over a 2-years follow-up period. Adjusted hazard ratio (aHR) was calculated by using Cox models adjusted for age, gender and number of concomitant drugs. Both outcomes were evaluated for dichotomous (TD and DD) and categorical variables of DD (TD, short DD and long DD).

Methodological aspects

Study type

Study type list

Study type:

Non-interventional study

Scope of the study:

Assessment of risk minimisation measure implementation or effectiveness

Disease epidemiology

Drug utilisation

Effectiveness study (incl. comparative)

Other

If ‘other’, further details on the scope of the study

Healthcare facilities utilization

Main study objective:

This project will firstly evaluate diagnostic delay in patients with ulcerative colitis. Then, we will assess the impact of diagnostic delay on effectiveness and safety clinical outcomes by analyzing drug-utilization and healtchare facilities usage.

Study design details

Outcomes

Diagnostic delay (DD): potential DD in patients with ulcerative - Drug utilization and effectiveness outcomes: time free from azathioprine, treatment with advanced therapy and surgery - Safety: time free from Emergency department access or hospitalization for any cause. All the outcomes will be evaluated for both dichotomous and categorical variable of DD.

Data analysis plan

Diagnostic delay: We will tabulate the distribution of dichotomous and categorical variables of interest in the study population. We will compute Chi-squared test at significance level $\alpha = 0.05$ to assess if there is difference between categories in dichotomous and categorical variables. Drug-utilization, effectiveness and safety: Kaplan-Meier survival analysis and Hazard Ratio with corresponding 95% Confidence Interval.
