Study description

This is a open-label observational study conducted to determine (levo)cetirizine levels in breast milk of breastfeeding women and monitor adverse events in nursing infants. In total, 25 to 40 lactating women in Norway will be recruited. The study is part of the IMI ConcePTION project, as a demonstration project in WP4 of ConcePTION.

Methodological aspects

Study type

Study type list

Study type:

Non-interventional study

Scope of the study:

Other

If ‘other’, further details on the scope of the study

Human lactation study

Main study objective:

Quantifying (levo)cetirizine excretion into human milk. Calculation of the relative infant dose (RID). Monitor the safety of (levo)cetirizine during breastfeeding.

Study Design

Non-interventional study design

Other

Non-interventional study design, other

Observational human lactation study

Study drug and medical condition

Study drug International non-proprietary name (INN) or common name

CETIRIZINE

Population studied

Age groups

Adults (18 to < 46 years)

Estimated number of subjects

25

Study design details

Outcomes

Variability of concentration of (levo)cetirizine in human milk samples. Maternal self-reported adverse events among breastfed infants. Maternal self-reported perceived changes in milk production
