Study description

Myocardial infarction affects about 5000 patients in Finland per year. Almost 20% of them die within one year after the event. Among the Nordic countries, cardiovascular death rates are the highest in Finland. Current guidelines advise to treat myocardial infarction patients with 12-month dual antiplatelet treatment. An ongoing PEGASUS-TIMI 54 clinical study aims to survey the advantages of longer use of ticagrelor and acetylsalicylic acid in secondary prevention. The aim of the present study is to describe the risk development and risk factors of subsequent cardiovascular events in patients discharged from hospital after myocardial infarction. The study questions focus on patients surviving more than one year without subsequent myocardial infarction or stroke and on patients with known additional risk factors. Pre-specified subgroup analyses in populations mimicking the PEGASUS-TIMI 54 study population in a real-life setting will be performed to enable comparison of real-life and randomised study settings.

Methodological aspects

Study type

Study type list

Study topic:

Disease /health condition

Study type:

Non-interventional study

Scope of the study:

Assessment of risk minimisation measure implementation or effectiveness

Disease epidemiology

Data collection methods:

Secondary use of data

Main study objective:

The main objective is to describe the risk development and risk factors of subsequent cardiovascular events in patients discharged from hospital after myocardial infarction. We study all patients alive one week after the discharge, and because the mortality is high during the first year, the main focus is in patients surviving without subsequent myocardial infarction or stroke more than one year.

Study Design

Non-interventional study design

Cohort

Study drug and medical condition

Medical condition to be studied

Acute myocardial infarction

Population studied

Short description of the study population

Myocardial infarction patients with 12-month dual antiplatelet treatment.

Age groups

- Adolescents (12 to < 18 years)
- Adults (18 to < 46 years)
- Adults (46 to < 65 years)
- Adults (65 to < 75 years)
- Adults (75 to < 85 years)
- Adults (85 years and over)

Special population of interest

Other

Special population of interest, other

Myocardial infarction patients

Estimated number of subjects

44000

Study design details

Outcomes

Myocardial infarction (ICD-10 I21-I22), Stroke (total) (ICD-10 I61-64), Cardiovascular mortality (death due to ICD-10 I21-I22, I61-64, I50, I48, I20.0), Composite end-point (deaths due to MI, stroke or cardiovascular mortality causes specified above), Overall mortality (death from any cause), Heart failure (ICD-10 I50), Atrial fibrillation (ICD-10 I48), Unstable angina pectoris (ICD-10 I20.0), Major bleedings (ICD-10 D62, D68.3, I60, J94.2, K22.1, K22.3, K22.6, K25.0, K25.2, K25.4, K25.6, K26.0, K26.2, K26.4, K26.6, K27.0, K27.4, K27.6, K28.0, K28.2, K28.4, K28.6, K29.0, K62.5, K63.1, K63.3, K92.0-K92.2, R04, R31, S06.4-S06.6)

Data analysis plan

R language will be used for in data management for creating the analysis database and in statistical analysis for creating tabulations and graphics as well as in all statistical modelling. If a variable is totally missing it is excluded from the analysis. If a variable is missing for only some of the patients a missing data category is added and used in the analysis. The principles of the statistical analysis by objectives are outlined in protocol. More detailed statistical analysis plans will be written separately.
