Study description

This study aims to characterise the use of upadacitinib (Rinvoq™) in routine clinical care, including describing baseline characteristics of individuals with rheumatoid arthritis exposed to upadacitinib relative to individuals with rheumatoid arthritis exposed to other systemic treatments. This study also aims to evaluate the effectiveness of additional risk minimisation measures.

Methodological aspects

Study type

Study type list

Study type:

Non-interventional study

Scope of the study:

Drug utilisation

Effectiveness study (incl. comparative)

Main study objective:

This study aims to characterise the use of upadacitinib (Rinvoq™) in routine clinical care.

Study drug and medical condition

Medicinal product name

RINVOQ

Medical condition to be studied

Rheumatoid arthritis

Population studied

Age groups

- Adults (18 to < 46 years)
- Adults (46 to < 65 years)
- Adults (65 to < 75 years)
- Adults (75 to < 85 years)
- Adults (85 years and over)

Estimated number of subjects

2400

Study design details

Outcomes

To describe the baseline characteristics of new users of upadacitinib (e.g. demographics, medical history, medical condition associated with upadacitinib use, and concomitant medication use), and in a similar manner, to describe new users of a selected biologic disease-modifying anti-rheumatic drug (bDMARD) for comparison. Evaluate the effectiveness of additional risk minimisation measures (aRMMs): quantify occurrence of upadacitinib in patients at high risk for a VTE and in patents currently being treated for active TB, quantify number of patients pregnant at time of initiation/become pregnant while taking upadacitinib, describe prescribing doctors' adherence to recommendations for patient screening/lab monitoring.

Data analysis plan

All analyses will be descriptive, no statistical tests will be performed. Analyses will be performed separately for each registry and exposure group (i.e. upadacitinib cohort and selected bDMARD cohort). Baseline patient characteristics will be assessed at study drug initiation. To address important safety information communicated in the healthcare professional educational material and patient alert card, outcome indicators at the time of initiation will be evaluated in the upadacitinib cohort. Additional outcome indicators will be assessed in the upadacitinib cohort during their continuous treatment.

Data management

ENCePP Seal

The use of the ENCePP Seal has been discontinued since February 2025. The ENCePP Seal fields are retained in the display mode for transparency but are no longer maintained.
