Study description

The study aims to gain an understanding of the clinical management of complicated influenza in ICUs in Europe and to investigate the clinical effectiveness of IV Zanamivir in the treatment of patients with complicated influenza in this setting.

Not applicable

Methodological aspects

Study type

Study type list

Study topic:

Human medicinal product

Study type:

Non-interventional study

Scope of the study:

Disease epidemiology

Effectiveness study (incl. comparative)

Main study objective:

Among ICU-admitted patients with complicated influenza, all-cause in-hospital mortality will be compared between patients who received IVZ treatment with a propensity score matched group of patients who did not receive this therapy during the same influenza season and/or pandemic(s).

Study Design

Non-interventional study design

Cohort

Study drug and medical condition

Name of medicine

DECTOVA

Study drug International non-proprietary name (INN) or common name

Population studied

Age groups

Infants and toddlers (28 days – 23 months)

Children (2 to < 12 years)

Adolescents (12 to < 18 years)

Adult and elderly population (≥18 years)

Adults (18 to < 65 years)

Adults (18 to < 46 years)

Adults (46 to < 65 years)

Elderly (≥ 65 years)

Adults (65 to < 75 years)

Adults (75 to < 85 years)

Adults (85 years and over)

Estimated number of subjects

1100

Study design details

Outcomes

The primary efficacy variable is defined as the length of time between the index date and all-cause in-hospital mortality. Patients who do not experience all-cause in-hospital mortality will be censored at 28 days post treatment/matching or at loss to follow up.

- All-cause in-hospital mortality up to end of follow-up (defined as 28 days post index date or at loss to follow-up)
- All-cause in-hospital mortality at Day 7, 10 and 14 after treatment initiation/matching
- Ordinal scale for clinical course of influenza disease at Day 7, 10 and 14 after

treatment initiation/matching

Data analysis plan

The primary analysis will consist of a matched cox regression model to estimate all-cause in-hospital mortality, presented as a hazard ratio for IV Zanamivir treatment vs matched control.
A similar regression analysis will be performed to estimate in-hospital survival on day 7, 10 and 14 after treatment initiation/matching, and a proportional odds regression model will be fitted to analyse the ordinal scale date on the same days.

Data management

ENCePP Seal

The use of the ENCePP Seal has been discontinued since February 2025. The ENCePP Seal fields are retained in the display mode for transparency but are no longer maintained.
