Study description

****This study was terminated prematurely for reasons unrelated to any safety or patient-related concerns, as no data was collected no report will be produced****

This is a retrospective, nationwide, multi-centre observational cohort study which aims to assess the healthcare resource utilization (HCRU) and clinical outcomes associated with the development of delayed cerebral ischaemia (DCI) following aneurysmal subarachnoid haemorrhage (aSAH). The study will use existing patient data held in medical charts and the Système National des Données de Santé (SNDS), the French national healthcare database. A total of 300 patients with aSAH will be recruited by eleven centres across France via consecutive stratified recruitment to obtain an approximately equal number of DCI and non-DCI patients. Physicians will be asked to extract relevant retrospective data from medical charts of patients admitted to their centre between 1st January 2017 and 31st December 2018. Patient chart data will be linked with data from the SNDS to obtain more comprehensive HCRU data and longer-term data on patient outcomes including mortality.

No

Is the study required by a Risk Management Plan (RMP)?

Not applicable

Methodological aspects

Study type

Study topic:

Disease /health condition

Study type:

Non-interventional study

Scope of the study:

Disease epidemiology

Data collection methods:

Secondary use of data

Main study objective:

To assess and compare hospital length of stay in patients with and without delayed cerebral ischaemia following aneurysmal subarachnoid haemorrhage

Study Design

Non-interventional study design

Cohort

Other

Non-interventional study design, other

Retrospective, nationwide, multi-centre observational study

Study drug and medical condition

Medical condition to be studied

Subarachnoid haemorrhage

Additional medical condition(s)

Aneurysmal subarachnoid hemorrhage

Population studied

Short description of the study population

Patients with subarachnoid haemorrhage identified from the medical charts and the Système National des Données de Santé (SNDS), the French national healthcare database.

Age groups

- Adults (18 to < 46 years)
 - Adults (46 to < 65 years)
 - Adults (65 to < 75 years)
 - Adults (75 to < 85 years)
 - Adults (85 years and over)
-

Special population of interest

Other

Special population of interest, other

Patients with subarachnoid haemorrhage

Estimated number of subjects

300

Study design details

Outcomes

The following patient outcomes will be assessed and compared: - Overall hospital length of stay - Intensive care unit length of stay - Length of stay in acute and subacute hospital settings (excluding inpatient rehabilitation centre stays) length of stay - Inpatient rehabilitation centre length of stay, The following patient outcomes will be assessed: - All-cause re-admissions to hospital - Imaging/diagnostic tests undertaken - Recue therapy requirements - Discharge location - Outpatient rehabilitation centre visits - All cause mortality - Direct costs - Indirect costs

Data analysis plan

Descriptive statistics will be used to describe and compare patient demographic and clinical characteristics according to patient DCI status. Propensity score methods will be used to balance differences between patients who did and did not develop DCI. Propensity scores will be derived for each patient using a logistic regression model including pre-specified confounders such as age, World Federation of Neurosurgical Societies grade, Modified Fisher scale, aneurysm size, aneurysm-securing procedure. Thereafter, the groups will be balanced using the Inverse Probability of Treatment Weighting (IPTW). Appropriate models (mixed effects logistic regression for binary variables, mixed effects linear regression model for continuous variables and count or rate variables) will be used to compare healthcare resource utilization and patient outcomes according to DCI status, accounting for IPTW.

Data management

ENCePP Seal

The use of the ENCePP Seal has been discontinued since February 2025. The ENCePP Seal fields are retained in the display mode for transparency but are no longer maintained.
