209452 - A targeted safety study, EPI-ZOSTER-030 VS US DB, to evaluate the safety of Shingrix in adults \geq 50 years of age in the United States

First published: 11/09/2020 Last updated: 05/06/2025

Administrative details

EU PAS number

EUPAS37156

Study ID

50411

DARWIN EU® study

No

Study countries

United States

Study description

Targeted safety study to assess the real-world safety of Recombinant zoster vaccine (RZV) in the US using a large distributed data network with a focus on specific health outcomes of interest in adults aged 50 and older.

Protocol Amendment 4 Anonymised 16 May 2025.pdf(2.96 MB) Protocol Amendment 3 Anonymised 20 May 2025.pdf(3.5 MB)

Regulatory

Was the study required by a regulatory body?

No

Is the study required by a Risk Management Plan (RMP)?

EU RMP category 3 (required)

Methodological aspects

Study type

Study type list

Study topic:

Human medicinal product

Study type:

Non-interventional study

Scope of the study:

Assessment of risk minimisation measure implementation or effectiveness

Main study objective:

To assess whether there is an increased risk of new-onset Guillain-Barré Syndrome (GBS), Gout, Polymyalgia Rheumatica (PMR), Giant Cell Arteritis (GCA), Ischemic Optic Neuropathy (ION) or Supraventricular Tachycardia (SVT) within specified time periods after RZV vaccination in people \geq 50 years of age enrolled starting in January 2018 at any of the participating U.S. Research Partners.

Study Design

Non-interventional study design Cohort Other

Non-interventional study design, other

Self-controlled risk interval design (a version of the self-controlled case series and the case-crossover designs)

Study drug and medical condition

Name of medicine SHINGRIX

Study drug International non-proprietary name (INN) or common name

RECOMBINANT VARICELLA ZOSTER VIRUS GLYCOPROTEIN E

Anatomical Therapeutic Chemical (ATC) code

(J07BK) Varicella zoster vaccines

Varicella zoster vaccines

Medical condition to be studied

Herpes zoster

Population studied

Age groups

Adults (46 to < 65 years) Adults (65 to < 75 years) Adults (75 to < 85 years) Adults (85 years and over)

Estimated number of subjects

723000

Study design details

Outcomes

The risk of new onset GBS (within 42 days) and Gout (within 30 days) following RZV vaccination using a Self-controlled Risk Interval (SCRI) design and the risk of new onset PMR (within 183 days) and GCA (within 183 days) following RZV vaccination using a cohort design. The risk of new onset SVT within 30 days following RZV vaccination using a SCRI design and the risk of new onset ION within 183 days following RZV vaccination using a cohort design.

Data analysis plan

The analysis plan includes descriptive measures to characterize exposed and unexposed individuals, conditional Poisson regression models for the SCRI, and Cox proportional hazards regression models for the cohort design outcomes Sentinel analytic tools will be used for the distributed analyses, modifications to the tools may be needed to meet study objectives. For each outcome there is a primary analysis, secondary analysis and sensitivity analysis. All the statistical calculations will be done in SAS 9.2 or higher.
