**Study description** 

This post-authorisation safety study is a worldwide, single-arm descriptive non-interventional study that collects prospective and retrospective data in women exposed to inclisiran during pregnancy. It uses an enhanced pharmacovigilance data collection and processing system via a set of targeted checklists, structured follow-up, rigorous process of data entry and data quality control, and programmed aggregate analysis. The overall objective of the study is to collect data on pregnancy outcomes in patients treated with inclisiran during or prior to pregnancy. Although pharmacovigilance data may be collected from any country in the world where the product is approved, the anonymized patient level data will be analyzed at a global level in Switzerland.

Study type

Study type list

### Study type:

Non-interventional study

### Scope of the study:

Safety study (incl. comparative)

### Main study objective:

To estimate the proportion of major congenital malformations among pregnancies exposed to inclisiran during pregnancy prospectively reported to Novartis amongst (i) live births and (ii) live births plus still births plus termination of pregnancy for fetal anomaly (TOPFA).

# Study Design

### Non-interventional study design

Cohort

inclisiran

# Population studied

### Age groups

Adolescents (12 to < 18 years)

Adults (18 to < 46 years)

Adults (46 to < 65 years)

### Special population of interest

Pregnant women

### **Estimated number of subjects**

500

# Study design details

### **Outcomes**

Major congenital malformations (MCM) among pregnancies exposed to inclisiran during pregnancy, • To estimate the proportion of MCM among pregnancies exposed to inclisiran prior to the last menstrual period (LMP) • To compare the frequency of MCM among pregnancies exposed to inclisiran with the background frequencies • To estimate the proportion of other secondary outcomes in pregnancies exposed to inclisiran prior to LMP and during pregnancy

### Data analysis plan

Data analysis will focus on the prospectively reported pregnancy cases. Retrospective pregnancy cases will also be analyzed and presented separately from the prospective cases. Data analysis will include the estimation of proportion (and 95% confidence interval) of malformations (major, minor, and overall), and of specific pregnancy outcomes such as live births, stillbirths, spontaneous abortions and elective terminations. Proportions will be estimated by timing of drug exposure in pregnancy (during pregnancy and prior to LMP, as

well as by trimester if sample size allows). Descriptive analysis will be performed for all prospective pregnancy cases including case disposition (outcome known, pending, and lost to follow-up) and maternal characteristics (i.e. age, ethnicity, region) by providing the number and percentage of pregnancies in each category. Further stratified analyses may be undertaken if sample size allows.
