Study description

This study will be a cross-sectional survey of knowledge of the risks and safe use of venetoclax as outlined in the patient card among adult patients who have recently received venetoclax for treatment of CLL per standard of care. Patients will be identified through a diverse selection of medical practices representing haematologists who prescribe venetoclax across at least 5 European countries. Patients will be invited to participate by their physician and will be asked to complete a one-time self-administered structured questionnaire.

Methodological aspects

Study type

Study type list

Study type:

Non-interventional study

Scope of the study:

Effectiveness study (incl. comparative)

Main study objective:

To assess patients' knowledge of the following: ? TLS as a risk of venetoclax treatment for CLL ? Symptoms of TLS ? Steps to take to reduce the risk of TLS ? Actions to take if symptoms of TLS appear To assess patients' use of the PC, including the following: ? Whether the patient keeps the PC on their person ? Whether the PC is shared with all medical providers when seeking care

Study Design

Non-interventional study design

Cross-sectional

Study drug and medical condition

Name of medicine

VENCLYXTO

Medical condition to be studied

Chronic lymphocytic leukaemia

Population studied

Age groups

Adults (18 to < 46 years)

Adults (46 to < 65 years)

Adults (65 to < 75 years)

Adults (75 to < 85 years)

Adults (85 years and over)

Estimated number of subjects

200

Study design details

Data analysis plan

The analyses will be descriptive in nature and will include distributions of the responses to all of the individual questions and, if appropriate, summary measures across logical groupings of questions. Descriptive tables will be generated for the patients overall and stratified by country and other identified variables of interest. Analysis tables will include the frequency and percentage of patients who select each response to each individual question.
