Study description

Opioid overdoses are the primary cause of mortality among problematic drug users globally. Naloxone, an opioid antagonist, can avert such fatalities by rapidly counteracting opioid effects. To address the frequent untreated overdoses due to the lack of recognition, fear of legal consequences, and lack of naloxone access, Take-Home Naloxone (THN) programs have been established, providing naloxone to potential bystanders in 12 European countries. This study will investigate the trend of naloxone use, particularly THN, across Europe, and elucidate user profiles to augment aggregated data from existing THN programs, thereby aiding the monitoring of naloxone use and informing regulatory decisions.

The objectives of this study are (i) To investigate the incidence and prevalence of THN use in (1) the general population and (2) among people with a recorded history of opioid use disorder during the study period 2017-2022. Analyses will be stratified by age, sex, calendar year and country/database. (ii) To provide summary baseline characteristics of “new” THN users including demographics, previous medical history, previous medication use and history of opioid use, overdose (iii) To study the use of THN in ”new” users including summary statistics of number of THN packages prescribed at index date for each “new” user (e.g. mean (SD), median, q25 and q75).

Methodological aspects

Study type

Study type list

Study type:

Non-interventional study

Scope of the study:

Drug utilisation

Study design:

- Population level cohort study
- New drug user cohort study

Main study objective:

(i) To investigate the incidence and prevalence of THN use in (1) the general population and (2) among people with a recorded history of opioid use disorder during the study period 2017-2022.
(ii) To provide summary baseline characteristics of “new” THN users
(iii) To study the use of THN in ”new” users

Study drug and medical condition

Name of medicine, other
naloxone Nasal Spray
naloxone Prefilled Syringe
naloxone Auto-Injector

Study drug International non-proprietary name (INN) or common name
NALOXONE HYDROCHLORIDE DIHYDRATE

Anatomical Therapeutic Chemical (ATC) code
(V03AB15) naloxone
naloxone

Additional medical condition(s)
Opioid-induced mood disorder due to opioid abuse, Intravenous nondependent opioid abuse, Nondependent opioid abuse (continuous and episodic), Opioid abuse, Nondependent opioid abuse, Opioid-induced mood disorder due to opioid dependence, Opioid dependence with current use, Opioid analgesic dependence, Opioid dependence, Episodic opioid dependence, Continuous opioid dependence, Combined opioid with other drug dependence, Fentanyl dependence, Methadone dependence, Opium dependence, Heroin dependence, Morphine dependence

Population studied

Short description of the study population

Population-level utilization of THN: All individuals present in the database in the period between 01/01/2017 and 31/12/2022 will be included in the analysis after 365 days of database history. Therefore, children aged <1year will be excluded.

Patient-level THN utilization: All “new” users of THN in the period between 01/01/2017 and 31/12/2022, with “new” users being defined as all people with a prescription THN within the study period, with at least 365 days of availability prior to the date of their THN prescription and no prescription of THN in the last 7 days (180 days for sensitivity analysis). Therefore, the same person can be a “new” user multiple times during the study period.

Age groups

Infants and toddlers (28 days – 23 months)

Children (2 to < 12 years)

Adolescents (12 to < 18 years)

Adults (18 to < 46 years)

Adults (46 to < 65 years)

Adults (65 to < 75 years)

Adults (75 to < 85 years)

Adults (85 years and over)

Estimated number of subjects

17700000

Study design details

Data analysis plan

Population-level THN use: Annual period prevalence of THN use and annual incidence rates per 100,000 person years in (1) the general population and (2) among people with a recorded history of opioid use disorder (OUD). Patient-level THN use: Summary baseline characteristics of “new” users incl. demographics and history of opioid use, overdose will be conducted. Index date will be the date of the respective prescription of THN for each person. Number of THN prescriptions/packages per “new” user at index date will be summarised and mean (SD), median, p25 and p75 provided. For all analyses a minimum cell count of 5 will be used when reporting results, with any smaller counts obscured.
