Study description

This prospective, longitudinal non-interventional cohort study will evaluate the safety and effectiveness of talazoparib and enzalutatmide in patients ages 18 years and older who are treated for mCRPC with a follow-up period of ≤ 3 years. Approximately 150 patients will be recruited from primary care centers, oncology clinics, and academic centers from the US, Germany, and Canada with the potential to include additional countries from the IDM region. Study enrollment will begin once the combination of talazoparib and enzalutamide is approved by local Health Authorities in the respective study countries. The study will be open for enrollment for a period of 2 years after the first patient has been enrolled. Follow-up for overall survival beyond the prespecified study monitoring period may be taken into consideration on an individual basis. Each patient’s treatment will be consistent with routine practice, corresponding with the recommendations in the local Health Authority approved product label and at the discretion of the treating physician. Tumor or germline genotyping to identify alterations in HRR genes is not a required study procedure, however screening may be conducted as part of clinical care and will be captured for this study. Patients aged 18 and older with a confirmed diagnosis of mCRPC who are initiating treatment with talazoparib and enzalutamide according to routine clinical practice will be followed for up to 3 years, or until loss to follow up, death, or study termination, whichever occurs the earliest. Follow-up eCRFs will be completed when a patient returns for clinic visits per routine clinical practice with data collection permissible at the time of enrollment into the study (baseline) and during months 1, 3, 6, 12, 18, 24, 30, and 36. Reporting of adverse events will begin after informed consent is collected and will continue through 28 days after the last dose of talazoparib and enzalutamide.

Regulatory

Was the study required by a regulatory body?

No

Is the study required by a Risk Management Plan (RMP)?

Not applicable

Methodological aspects

Study type

Study type list

Study type:

Non-interventional study

Scope of the study:

Effectiveness study (incl. comparative)

Safety study (incl. comparative)

Main study objective:

To characterize the effectiveness and safety profile of talezoparib and enzalutamide To describe supportive care measures, healthcare utilization, and physician management in relation to safety outcomes To evaluate quality-of-life

(QoL) To capture the next anti-cancer treatment after discontinuation of talazoparib and enzalutamide

Study Design

Non-interventional study design

Cohort

Study drug and medical condition

Medicinal product name

TALZENNA

XTANDI

Medical condition to be studied

Hormone-refractory prostate cancer

Population studied

Age groups

- Adults (18 to < 46 years)
- Adults (46 to < 65 years)
- Adults (65 to < 75 years)
- Adults (75 to < 85 years)
- Adults (85 years and over)

Estimated number of subjects

150

Study design details

Outcomes

Outcomes of interest: Effectiveness: real-world progression free survival (rwPFS), second real-world progression-free survival (rwPFS-2), real-world overall survival (rwOS), PSA response, PSA doubling time, real-world objective response rate (rwRR), and real-world time to next treatment (rwTTNT) Safety: safety events of interest Healthcare resource use

---

Data analysis plan

The characteristics captured during baseline assessment and follow up will be summarized using descriptive statistics. To evaluate the safety of talazoparib and enzalutamide, AEs and SAEs will be characterized by type, grade, timing, and seriousness. Cumulative incidence will be calculated as appropriate and will be further described in the SAP. For the effectiveness outcomes of interest, rwPFS2, rwPFS, and rwOS (time to event outcomes) will be evaluated using Kaplan-Meier (KM) methods. KM curves will be illustrated and the median survival and corresponding 95% confidence interval (95% CI) will be computed. Subgroup analyses may be conducted by HRRm status, prior treatment lines

(NHTs, taxane, etc.), age, race/ethnicity, year of enrollment, enrollment country, and other key subgroups pending sufficient sample size.

Data management

ENCePP Seal

The use of the ENCePP Seal has been discontinued since February 2025. The ENCePP Seal fields are retained in the display mode for transparency but are no longer maintained.
