#### Study description

The aim of this project is to evaluate the comparative effectiveness of the monovalent XBB.1.5-containing Covid-19 vaccines in preventing severe Covid-19 outcomes among individuals aged 65 years or older. The study objectives include assessing vaccine effectiveness for preventing severe Covid-19 outcomes, evaluating waning effectiveness, and examining the impact of coadministration with influenza vaccines. We conduct nationwide register-based cohort analyses in Denmark, Finland, and Sweden from October 2023 to the latest available date in 2024. Source cohorts comprise known residents who received at least four Covid-19 vaccine doses between December 27, 2020, and the latest available date in 2024. Study cohorts include individuals aged 65+ eligible for an XBB.1.5-containing Covid-19 vaccine as a fifth or sixth dose. Outcomes of interest are Covid-19 hospitalization and death. Covariates include demographic factors, comorbidities, and previous Covid-19 vaccinations. We aim to include at least 3.1 million vaccine recipients across the three Nordic countries, utilizing all available data and ensuring statistical power reflected in 95% confidence intervals. Target trial emulation compares vaccinated individuals with controls in matched survival analyses, providing comparative effectiveness estimates while considering various covariates.

Study type

Study type list

**Study topic:** 

Human medicinal product

**Study type:** 

Non-interventional study

Scope of the study:

Effectiveness study (incl. comparative)

#### Main study objective:

The aim of this study is to evaluate the comparative effectiveness of the monovalent XBB.1.5-containing Covid-19 vaccines in preventing severe Covid-19 outcomes among individuals aged 65 years or older.

# Study Design

#### Non-interventional study design

#### Medical condition to be studied

COVID-19

### Population studied

#### Short description of the study population

Source cohorts will consist of all individuals who are known residents in the three Nordic countries and have received at least four Covid-19 vaccine doses between 27 December 2020 and latest available date in 2024. The study cohorts will consist of individuals who are at least 65 years of age in Denmark, Finland, and Sweden and eligible to receive an XBB.1.5-containing Covid-19

vaccine as a fifth or sixth dose during the study period.

#### Age groups

Elderly (≥ 65 years)

Adults (65 to < 75 years)

Adults (75 to < 85 years)

Adults (85 years and over)

#### **Estimated number of subjects**

3100000

### Study design details

#### **Outcomes**

The outcomes of interest are Covid-19 hospitalization and Covid-19 related death.

#### Data analysis plan

We will take advantage of the unique nationwide register-data available to us, and construct country cohorts with individual-level information on dates of vaccination and dates of effectiveness end-points together with relevant covariate information. Using target trial emulation, we will compare bivalent booster dose recipients head-to-head and with unboosted individuals in matched survival analysis that provides comparative effectiveness estimates while taking into account a range of covariates.
