Study description

The overall aim of this study is to evaluate the effectiveness of additional risk minimization measures (aRMM) by estimating incidence rates of infusion site events (i.e., infusion site infections and/or serious infusion site reactions) in Parkinson disease (PD) patients exposed to ABBV-951 in real-world clinical practice, using data sources from Finland and France. The frequency of infusion site events observed in this real-world study will be interpreted in context of the predefined reference value which is the frequency of the infusion site events reported in the AbbVie clinical trial. The following objectives will be investigated among patients with advanced PD following initiation of treatment with ABBV-951:

• To quantify the incidence rate of first infusion site events (first infusion site infection OR first serious infusion site reactions)
• To quantify the incidence rate of first infusion site infection
• To quantify the incidence rate of first serious infusion site reaction

Study protocol

P24151-Protocol v1.0_Redacted.pdf(1.24 MB)

Regulatory

Was the study required by a regulatory body?

Yes

Is the study required by a Risk Management Plan (RMP)?

EU RMP category 3 (required)

Methodological aspects

Study type

Study type list

Study topic:

Human medicinal product

Study type:

Non-interventional study

Data collection methods:

Secondary use of data

Study design:

A longitudinal, retrospective cohort study of individuals with advanced PD treated with ABBV-951 in Finland and France. The overall study period will be from the date of market availability (anticipated Q4 2023) until Q1 2027. Index date will be defined as the date of first initiation of ABBV-951.

Main study objective:

• To quantify the incidence rate of first infusion site event (first infusion site infection OR first serious infusion site reaction)
• To quantify the incidence rate of first infusion site infection
• To quantify the incidence rate of first serious infusion site reaction

Study Design

Non-interventional study design

Cohort

Study drug and medical condition

Name of medicine, other

Foslevodopa/Foscarbidopa

Medical condition to be studied

Parkinson's disease

Population studied

Special population of interest

Immunocompromised

Other

Special population of interest, other

Diabetes Mellitus

Study design details

Outcomes

• Infusion site event (first occurrence only) defined as infusion site infection OR serious infusion site reaction

• Infusion site infection (first occurrence only)

• Serious infusion site reactions (first occurrence only)
