Study description

Clozapine is an effective treatment for treatment-resistant schizophrenia and Parkinson’s disease psychosis, but it carries a risk of severe hematological complications, including neutropenia and agranulocytosis.
Emerging evidence suggests that the risk is highest in the initial months of treatment, yet stringent hematological monitoring requirements remain in place throughout long-term use.
These requirements may hinder clinical practice, leading to underuse, early treatment discontinuation, or reluctance to initiate therapy.
This study aims to provide epidemiological evidence on the incidence and timing of clozapine-associated neutropenia and agranulocytosis across Europe.

Methodological aspects

Study type

Study type list

Study topic:

Human medicinal product

Study type:

Non-interventional study

Scope of the study:

Disease epidemiology

Data collection methods:

Secondary use of data

Study design:

A cohort study will be conducted using routinely collected health data from 5 data sources. The study will comprise three consecutive parts:

• Population-level cohort study (Objective 1, Population-level descriptive epidemiology of agranulocytosis and neutropenia in new users of clozapine).

• Cohort

Main study objective:

1. To estimate the incidence rates of agranulocytosis and neutropenia in consecutive weekly and monthly intervals following the initiation of clozapine treatment, overall and stratified by age and sex.

2. To characterise the timing of agranulocytosis and neutropenia events during clozapine treatment using Kaplan-Meier curves, overall and stratified by age and sex.

3. To characterise individuals initiating clozapine treatment in terms of demographics and pre-specified conditions related to the indication for clozapine use.

4. To determine the treatment duration for clozapine use.

Study Design

Non-interventional study design

Agranulocytosis

Population studied

Short description of the study population

The study population will include all new users of clozapine registered in the respective data sources between 1st of January 2010 and 31st of December 2024 (or latest date available).

“New use” refers to a first prescription of clozapine within the study period with no clozapine prescription in the medical history.

Eligibility Criteria:

At least 1 year of data visibility before starting clozapine treatment.

Additional eligibility criteria:

To ensure sufficient follow-up, only individuals who initiated clozapine treatment at least one year before the end of the available data in the respective data source will be included.

Age groups

- **In utero**
- **Paediatric Population (< 18 years)**
  - Neonate
    - Preterm newborn infants (0 – 27 days)
    - Term newborn infants (0 – 27 days)
  - Infants and toddlers (28 days – 23 months)

    - Children (2 to < 12 years)
    - Adolescents (12 to < 18 years)
- **Adult and elderly population (≥18 years)**
    - Adults (18 to < 65 years)
        - Adults (18 to < 46 years)
        - Adults (46 to < 65 years)
    - Elderly (≥ 65 years)
        - Adults (65 to < 75 years)
        - Adults (75 to < 85 years)
        - Adults (85 years and over)
