Institution description

The main emphasis of research in the Cancer Epidemiology Unit is on providing large-scale reliable evidence on the relationship between common exposures (such as diet, reproductive factors, and the use of oral contraceptives and hormone replacement therapy) and common conditions of public health importance such as breast, prostate, and cervical cancers, cardiovascular disease and fractures. Much of this work centres on the two large scale cohort studies run by the Unit (the Million Women Study and EPIC-Oxford), and on the several International Collaborative Groups based in the Unit. Current research areas also include work on statistical and epidemiological methodology, and a programme of work related to the National Health Service screening programmes for breast, cervical and bowel cancers. The Unit is funded by Cancer Research UK and by a programme grant from the Medical Research Council, and is part of the Nuffield Department of Clinical Medicine at the University of Oxford.

Institution details

Experience with collecting data directly from individual patients or respondents:

Yes

Interest in carrying out research that is funded by pharmaceutical companies:

No
