

Summary Table of Study Protocol

Title	An Observational Study to Evaluate the Potential Association Between Cinacalcet and Gastrointestinal Bleeding
Protocol version identifier	20170171
Date of last version of the protocol	12 February 2018, Amendment 3
EU Post Authorisation Study (PAS) Register No	TBD
Active Substance	ATC Code H05BX01, cinacalcet
Medicinal Product	Sensipar® (cinacalcet)
Product Reference	EU/1/04/292
Procedure Number	NA
Marketing Authorisation Holder(s)	Amgen Inc.
Joint PASS	No
Research Question and Objectives	To assess the potential association between cinacalcet use and risk of gastrointestinal bleeding in patients receiving maintenance hemodialysis
Country of Study	United States
Authors	PPD [REDACTED], PhD, Amgen Inc. PPD [REDACTED], PhD PPD [REDACTED], PhD PPD [REDACTED], MD, MS PPD [REDACTED], MS PPD [REDACTED], MS Chronic Disease Research Group 914 S 8th Street, Suite S2.100 Minneapolis, MN 55404

3. Abstract

Study Title: An Observational Study to Evaluate the Potential Association Between Cinacalcet and Gastrointestinal Bleeding

Study Background and Rationale:

Gastrointestinal (GI) bleeding is a frequent complication of chronic kidney disease (CKD) among dialysis patients. GI bleeding was estimated to be responsible for 1.4% of hospitalizations among US Medicare-insured hemodialysis patients in 2013, with an admission rate of 23 per 1,000 patient-years. The death rate (per 1,000 patient-years) from GI bleeding in US Medicare hemodialysis patients was estimated to be 0.9 in 2013, and 0.5% of deaths were due to GI bleeding. Patients with kidney disease are at elevated risk of GI bleeding due to the disease itself and its attendant comorbid conditions, but also may be related to the many medications commonly used in this population. Demographic characteristics associated with an elevated risk of GI bleeding include age 50 years or older, female sex, and hypertension as cause of end-stage renal disease (ESRD). Previous episodes of GI bleeding were strongly associated with GI bleeding risk also (HR = 3.93, 95% CI: 3.82-4.05).

The Food and Drug Administration (FDA) informed Amgen of a requirement to conduct a post-marketing observational study to assess the potential association between Sensipar (cinacalcet) and fatal and non-fatal gastrointestinal bleeding.

This observational study is designed to assess the potential association between cinacalcet use and the risk of fatal and non-fatal GI bleeding in patients receiving maintenance dialysis, using a nested case control study design.

Research Question and Objective(s):

To assess the potential association between cinacalcet use and risk of gastrointestinal bleeding in secondary hyperparathyroidism (HPT) patients receiving maintenance hemodialysis.

Study Design/Type:

Case-control study nested within a cohort of hemodialysis patients with secondary HPT. A case, defined as a patient who experienced GI bleeding in the case assessment period (see [Case Assessment Period](#) below), will be matched to up to four controls on the basis of age, race, sex, time on dialysis, and PTH level (<600 pg/ml and ≥600 pg/mL). The date of the first recorded GI bleeding event (the event date of the case), fatal or non-fatal will be set as the index date for the matched controls (ie, index

date will be the same for the cases and the patients in the risk set). [Figure 1](#) and [Figure 2](#) show the study design schema.

Study Population or Data Resource:

This study will include Medicare hemodialysis patients with secondary HPT who received dialysis in a DaVita, Inc., dialysis facility between 2007 and 2010 (the study period). DaVita electronic medical record (EMR) data linked to Medicare ESRD claims during the period 2006-2010 will be used for this study (linked DaVita-USRDS database).

Summary of Patient Eligibility Criteria:

- This study will include hemodialysis patients who satisfy the following criteria in the period of 2007-2010:
 - Age \geq 18 years
 - At least 91 days on hemodialysis
 - Covered by Medicare Parts A, B, and D for at least 1 year
 - Received hemodialysis for at least 91 days in a DaVita dialysis facility
 - Parathyroid hormone (PTH) >300 pg/mL during the baseline period
 - No cinacalcet use for one year (baseline period)
 - No GI bleeding event for one year (baseline period)
- Patients will be excluded from the study for the following reasons:
 - History of parathyroidectomy (PTx)
 - Previous kidney transplant

Case Assessment Period:

The case assessment period for each patient will be from the first day of meeting the inclusion/exclusion criteria in the study period, designated as the “cohort entry date,” to the earliest date of GI bleeding, death, loss of Medicare coverage (any of Parts A, B, or D), PTx, change to peritoneal dialysis, or kidney transplant.

Variables:

1. *Outcome Variable:* the outcome is the composite event of fatal and non-fatal GI bleeding. A fatal GI bleeding will be defined as death with GI bleeding as a cause and a non-fatal GI bleeding event will be defined as a hospitalization with GI bleeding as the primary diagnosis.
2. *Exposure:* Use of cinacalcet. Cinacalcet use will be determined from Medicare Part D claims using National Drug Codes (NDCs). Exposure will be defined in different ways, including no use, any use, current use (within 61 days prior the index date), past use (use between cohort entry date and 61 days prior to the index date), cumulative exposure time, and cumulative dose.

3. *Other variables:* Other variables that will be considered are age, race, sex, ESRD cause, time on dialysis, geographic region, laboratory tests, comorbid conditions, prior GI bleeding events, and medication use.

Study Sample Size:

The outcome will be the combined events of GI bleeding hospitalization and death due to GI bleeding. Based on feasibility analysis, it is anticipated that approximately 2,500 patients with a GI bleeding event (97.6% GI bleeding hospitalizations and 2.4% death due to GI bleeding) will be identified in the study period. Matching up to 4 controls for every case, it is anticipated to result in 11,750 patients will be included in this study.

Data Analysis:

Descriptive statistics will be used to compare cases and controls, with respect to demographic, comorbidity and, dialysis and medication use characteristics. The odds of exposure among case and controls will be calculated. Conditional logistic regression will be used to estimate the OR and associated 95% confidence interval (CI) for the association between cinacalcet use (reference = no cinacalcet use) and risk of fatal and non-fatal GI bleeding adjusting for other potential confounders. If the upper limit of the 95% confidence interval of the estimated OR is less than 1.30, the conclusion will be that cinacalcet use is associated with a less than 30% increased risk of fatal or non-fatal GI bleeding.

4. Amendments and Updates

None.

5. Rationale and Background

5.1 Diseases and Therapeutic Area

Gastrointestinal (GI) bleeding is a frequent complication of chronic kidney disease (CKD)¹; risk is up to a five-fold higher than in people without CKD.^{2,3} The occurrence rate of GI bleeding among dialysis patients is estimated at 57 episodes per 1,000 person-years.⁴ Hospitalizations due to GI bleeding among dialysis patients are estimated at 1.4%, and the corresponding admission rate at 23 per 1,000 patient-years.⁵ The 30-day mortality rate after GI bleeding is 10.7%.¹ The death rate (per 1,000 patient-years) from GI bleeding among dialysis patients was estimated to be 0.9 in 2013, while the percentage of deaths due to GI bleeding was 0.5%.⁵ An episode of prior GI bleeding in long-term dialysis patients is associated with an increased hazard of death (HR = 1.90, 95 % CI: 1.86-1.93).⁶ In a large study using United States Renal Data

System (USRDS) data for patients receiving long-term dialysis, chronic gastric ulcer and colonic diverticulosis were the most frequently defined risk factors for GI bleeding, respectively.⁷ Age 50 years or older, female sex, hypertension as cause of end-stage renal disease (ESRD), and initiation of hemodialysis were associated with a greater risk of GI bleeding. Additionally, a previous episode of GI bleeding was associated with a substantially greater risk of a subsequent episode (HR = 3.93, 95% CI: 3.82-4.05).⁶ Increased risk of GI bleeding among CKD patients is associated with CKD itself and with attendant comorbid conditions, and studies show that medications used in CKD patients might also increase the risk of GI bleeding.^{2,3,8}

5.2 Rationale

The Food and Drug Administration (FDA) informed Amgen of a requirement to conduct a post-marketing observational study to assess the potential association between Sensipar (cinacalcet) and fatal and non-fatal gastrointestinal bleeding.

This nested case control study is designed to address the FDA requirement by assessing the potential association between cinacalcet use and the risk of fatal and non-fatal GI bleeding among hemodialysis patients using the linked DaVita-USRDS database.

We chose the nested case-control study design to create one-analytic dataset that uses all available cases and provides us the added efficiency of assessing multiple exposure definitions using a single dataset. The study design also allows us to address the issue of patients who repeatedly start and stop cinacalcet, which poses some analytic challenges when considering alternative approaches to account for the discontinuation and reinitiation of therapy and cumulative exposure, eg, inverse probability weighting. Additionally, the specific results of the simulation analysis of Austin et al. indicate that the NCC is actually a better study design in the time-varying treatment scenario when the percentage of subjects who experienced an event was low (5%) and the prevalence of treatment was 25%. In this scenario, the cohort design resulted in estimates with greater relative bias compared to the nested case-control design with similar efficiency as measured by MSEs and relative CI widths. GI bleeds occur in about 5% of the patient population and cinacalcet use in the patient population is about 20-30%, suggesting the NCC study design would perform well.

5.3 Statistical Inference (Hypothesis)

The hypothesis test is as follows:

H₀: Cinacalcet use is associated with a 30% or more increased risk (OR≥1.30) of fatal and non-fatal GI bleeding

H₁: Cinacalcet use is associated with a less than 30% increased risk of fatal and non-fatal GI bleeding

Our choice for a non-inferiority margin, OR=1.30, indicates that an observed upper confidence limit below 1.30 would result in the rejection of the null hypothesis and the conclusion that cinacalcet is associated with a less than 30% increased risk of GI bleeds. If our confidence limit includes 1.30, it indicates that we cannot reject the null. Based on our preliminary analysis, the anticipated GI bleeding event numbers will be sufficient for a statistical hypothesis test at a NI margin of 1.30. This margin has been used to understand risk of cardiovascular events in patients with diabetes and we think it is reasonable to apply a similar parameter in our setting.

6. Research Question and Objectives

To assess the potential association between cinacalcet use and risk of fatal and non-fatal GI bleeding in hemodialysis patients with secondary HPT.

7. Research Methods

7.1 Study Design

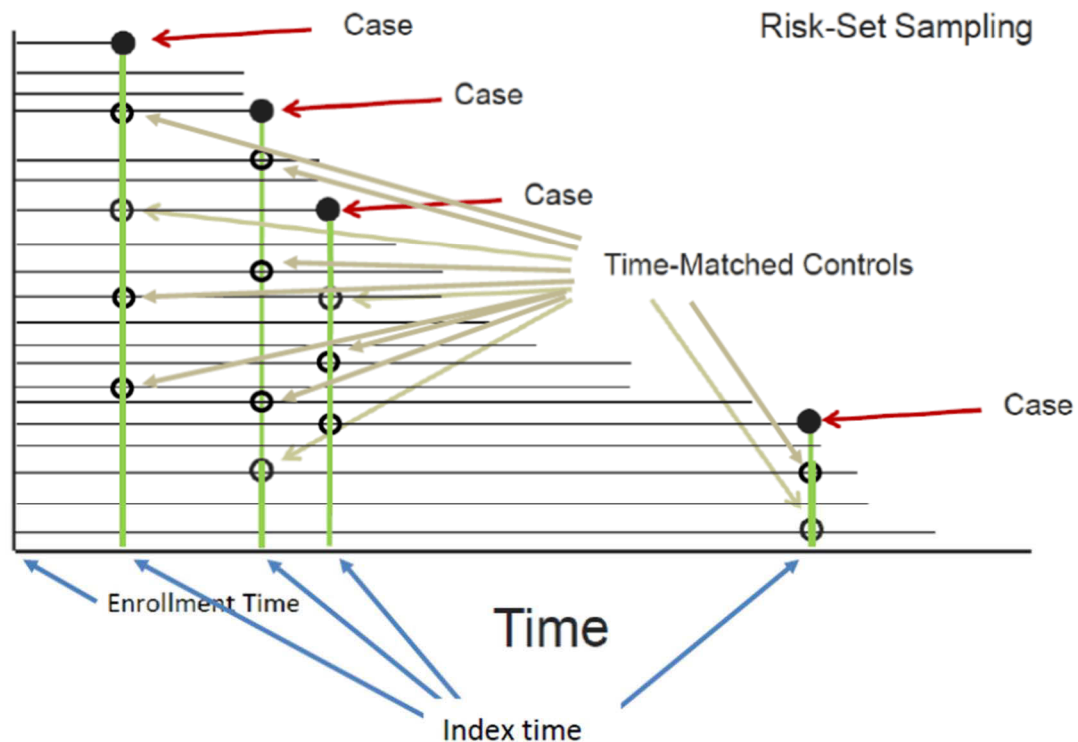

The sponsor proposes a matched case control study using incidence density sampling.⁹⁻¹² A matched case-control study is more efficient in the computational process and accounts for the time-varying nature of exposure to cinacalcet. This is particularly relevant to studies of patients on hemodialysis receiving treatment with cinacalcet as they frequently discontinue and reinstate treatment. The study design additionally allows the flexibility to assess the risk of events for multiple exposure subsets (see [Section 7.2.6](#)); one single analytic dataset comprised of cases and controls can be used for testing the potential association between cinacalcet and GI bleeding using multiple definitions of exposures.

ICD-9 codes will be used to identify GI bleeds ([Appendix 1](#)) and Medicare Part D NDC codes will be used to identify cinacalcet users ([Appendix 2](#)).

Patients will be defined as a case if they experience a first GI bleeding event during the case assessment period (see [Section 7.2.3](#)). Each case will be matched to up to four controls who were alive and at risk of having a GI bleeding event as of the case date

(ie, the risk set) (see [Section 7.2.3](#)). Cases and controls will be matched based on age (+/- 1 year), race (black, white, other), sex, time on dialysis (within the same year on dialysis category), and baseline PTH level (in the same category: see [Section 7.2.7](#)) at cohort entry date (see [Section 7.2.2.1](#)). These matching variables are important prognostic indicators in dialysis patients and are traditionally associated with cinacalcet exposure. [Section 7.2.7](#) provides details about the definitions of all variables in this analysis and [Figure 2](#) shows the case to control matching schema.

Figure 2. Matching Using Incidence-density Sampling

7.2 Setting and Study Population

7.2.1 Study Period

The study period is 01 January 2007 through 31 December 2010.

7.2.2 Subject/Patient/Healthcare Professional Eligibility

7.2.2.1 Inclusion Criteria

This study will include hemodialysis patients who, between 2007 and 2010, satisfy the following criteria:

1. Age \geq 18 years
2. At least 91 days on hemodialysis
3. Covered by Medicare Parts A, B, and D for at least 365 days

4. Received hemodialysis for at least 91 days in a DaVita dialysis facility
5. Parathyroid hormone (PTH) >300 pg/mL during the baseline period
6. No cinacalcet use for 365 days (baseline period)
7. No GI bleeding event for 365 days (baseline period)

Cohort entry date will be considered the first date all criteria above are met.

7.2.2.2 Exclusion Criteria

Patients meeting the following criteria before the cohort entry date will be excluded from the study:

1. History of parathyroidectomy (PTx)
2. Previous kidney transplant

To define the study cohort from which cases and controls will be identified, patient age, ESRD onset date, previous kidney transplant, and Medicare coverage will be identified from the patient file and payer file from the USRDS database, specifics of this database are described in [Section 7.3](#); and PTx will be identified using International Classification of Diseases, Ninth Revision, Clinical Modification (ICD-9-CM) procedure code 06.8x (in any position) on Medicare Part A inpatient claims. Information on dialysis facility, and patient PTH levels will be obtained from the DaVita cohort file, and lab file in the DaVita database. See [Section 7.2.7](#) for variable assessment information.

7.2.3 Case Assessment Period and Definition of Risk Set

The case assessment period for each patient will be from the cohort entry date to the earliest date of GI bleeding, death, loss of Medicare coverage (any of Parts A, B, or D), PTx, kidney transplant, or change to peritoneal dialysis.

7.2.4 Outcome Assessment (Defining Cases)

The outcome in this study is a GI bleeding event requiring an overnight hospital stay or death with GI bleeding listed as a cause. GI bleeding must be listed as the primary diagnosis in the hospitalization discharge summary for it to constitute a GI bleeding event. The ICD-9-CM diagnosis codes used to identify GI bleeding from claims are listed in [Appendix 1](#). These codes are widely used to define GI bleeding from medical claims in literatures.^{1,7,13-17} Death due to GI bleeding will be identified from the Centers for Medicare & Medicaid (CMS) ESRD Death Notification (form CMS-2746), as primary or secondary cause of death. The date of the first GI bleeding episode (or more precisely, the diagnosis date in the claim if the event is non-fatal GI bleeding or the death date if the event is fatal GI bleeding) will be designated as the index date.

7.2.5 Defining Controls

All patients who were alive and at risk of having a GI bleeding event at the time of a case event are eligible to be selected as a control. Patients cannot be selected as a control for more than one case on the same date. A patient can be selected as a control multiple times before an event of GI bleeding or death due to GI bleeding occurs, but cannot be selected as a control after the occurrence of an event of interest (ie, a control patient may become a case at a later date if/when an event of GI bleeding occurs, but a case cannot be used as a matched control subsequent to their event). We are matching cases and controls exactly on time since cohort entry ([Figure 2](#)); incidence density sampling, where cases and controls are matched exactly on time (the caliper is exact number of days) since cohort entry to index date, accomplishes this by definition.

7.2.6 Exposure Assessment

The exposure in this study is cinacalcet use. Cinacalcet use will be identified from Medicare Part D drug event files using National Drug Codes (NDCs) listed in [Appendix 2](#). Exposure will be defined in different ways, including no use, any use, current use (mutually exclusive of past use), past use (mutually exclusive of current use), cumulative dose, and cumulative exposure time on cinacalcet (see [Table 1](#) below). We will assess cinacalcet exposure over the period of time from cohort entry date to the index date. No use will be defined as no cinacalcet use from cohort entry date to the index date. Any use will be defined as cinacalcet use during the period of time from cohort entry date to the index date. Current use is defined as any cinacalcet use within the 61 days before the index date, including prescriptions that start with a dispensing before the 61 days, but whose projected days of supply range into the 61-day period. Past use is defined as any cinacalcet use between enrollment date and 61 days before the index date and no use during the 61 days prior to the index date, including no prescription whose projected days' supply range into the 61 day window. Sensitivity analyses, described below, will be conducted to assess risk by varying exposure windows. The categorical exposure variables describing cumulative exposure and cumulative dose that will be used in the analysis will be defined based on the cumulative exposure and cumulative dose distributions observed among controls. Cumulative exposure will be calculated by adding the total days' supply during the time window of exposure. Overlapping days' supply will be added to the end of an episode. Calculating the assessment period in this manner will account for the added days' supply from overlapping prescriptions, and therefore, the addition of a grace period between

subsequent prescriptions is not necessary. These categories will be assessed for the any use exposure definition.

Table 1. Exposure Definitions and Baseline Comorbidity Assessment Period

Cinacalcet Exposure/ Reference Category	Exposure Definition	Comorbidity Assessment Period
Any Use/ No Cinacalcet Use	Any cinacalcet use between enrollment date and the index date	Baseline period*
Current Use/ No Cinacalcet Use	Any cinacalcet use within the 61 days before the index date	Baseline period*
Past Use/ No Cinacalcet Use	Any cinacalcet use between enrollment date and 61 days before the index date and no use during the 61 days prior to the index date	Baseline period*
Cumulative Exposure**/ No Use	Total days on cinacalcet for the “any” cinacalcet use exposure definition	Baseline period*
Cumulative Dose***/ No Use	Total cinacalcet dose for the “any” cinacalcet use exposure definition	Baseline period*

* Baseline period defined as 365 days prior to enrollment date.

** Patients will be grouped based on the distribution of the cumulative days in the corresponding period.

*** Patients will be grouped based on the distribution of the cumulative dose in the corresponding period.

Models using different exposure definitions will be used to assess the association between cinacalcet use and GI bleeding.

7.2.7 Other Variable Assessment

The other variables that will be assessed include the matching variables (age, sex, race, time on dialysis, PTH level (<600 and ≥600 pg/mL)) and other candidate confounders (geography region, cause of ESRD, comorbid conditions, and medication use). All covariate variables will be defined during the 365 days preceding the cohort entry date (see [Table 1](#) for a description of the comorbidity assessment windows). Based on the baseline period all patients will have 1 year (365 days) of data to assess comorbidities. For all exposure assessment periods (any, past and current use) we will only use this period of time to assess comorbidities and medication use.

1. Age: Each patient’s age will be determined based on the birthdate provided on the Medical Evidence Report (form CMS-2728). For descriptive analysis, patients will be grouped into the following age categories: 18-44, 45-64, 65-74, 75-84, or ≥ 85 years.
2. Race (white, black, Asian, and other), sex, and ESRD cause (diabetes, hypertension, glomerulonephritis, and other) will also be obtained from the Medical Evidence Report.
3. Time on dialysis: We will determine each patient’s time on dialysis using the first service date in the patient profile. The first service date of dialysis is captured from

Medical Evidence report (CMS-2728 form) and time on dialysis will be calculated from this date. The date is a required field and is captured for patients who started dialysis before Medicare became their primary payer for dialysis service and for patients who started dialysis in a non-DaVita facility. Submission of the 2728 form is required by law when a patient begins dialysis, regardless of payer. We will categorize time on dialysis as 91 days-1 year, and 1-3, 3-5, or ≥ 5 years as of the period from dialysis initiation date, for the descriptive analysis and match time on dialysis with +/- 1 year caliper.

4. Geographic regions will be the 10 Medicare regions (see [Appendix 3](#)), which were defined based on the state where the patient lived.
5. Comorbid conditions: Comorbid conditions and the diagnosis codes to be used to identify the conditions from medical claims (see [Appendix 5](#)). To define a disease/condition, we require that a diagnosis appear on at least one inpatient, skilled nursing facility, home health, or hospice claim or on at least two outpatient/Part B claims at least 30 days apart.¹⁸
6. Medication use: Medications (by generic name and category) that may be related to GI bleeding will be identified from the Medicare Part D drug event file using the corresponding NDC codes (see [Appendix 6](#)).
7. Patient PTH level will be derived from the DaVita laboratory data file.

7.2.8 Validity and Reliability

One part of the outcome is GI bleeding hospitalization. We will consider a hospitalization as an outcome only when the GI bleeding diagnosis code is found in the principal position. The codes to be used to define GI bleeding have been used/validated by several studies¹³⁻¹⁷, including Sentinel reports.^{15,16} CMS "Accuracy of Coding in the Hospital-Acquired Conditions–Present on Admission Program" has shown that the code accuracy for inpatient claims is high.¹⁹ Since only patients with Medicare as their primary payer for both Part A and Part B are included in the study, the hospitalization data for these patients is expected to be complete.

Deaths due to GI bleeding will also be included as part of the outcome. We will capture deaths due to GI bleeds from the CMS Death Notification form (CMS-2746). Medicare requires dialysis facilities to submit CMS-2746 within two weeks following the death of a patient. GI bleeding as a cause of death is accurate with high sensitivity and specificity, 92% and 100%, respectively.²⁰

In this study, the exposure will be defined based on the Medicare Part D event file. To maintain accurate claims by Medicare Part D sponsors, the CMS routinely performs Prescription Drug Event audits. With the increased oversight from CMS, accurate claim submission has been crucial for Participating Pharmacies. Therefore, accuracy of the

Medicare Part D drug event file is high. Now, Medicare part D claim files have been used as the reference for validating other data for drug use and cost.²¹ After the Part D program started, the Medicare Current Beneficiary Survey uses the Part D claims, rather than household reports, to measure use and expenditures covered by Medicare, and survey reports for use covered by other payers.

7.3 Data Sources

The 2006-2010 linked DaVita-USRDS database will be used for this study, which includes information on all patients who were covered by Medicare and received dialysis in a DaVita dialysis facility.

The United States Renal Data System (USRDS) is a national data system that collects, analyzes, and distributes information about chronic kidney disease (CKD) and end-stage renal disease (ESRD) in the United States. The Centers for Medicare & Medicaid Services (CMS) send their information on dialysis patients to the USRDS for this function. The USRDS is funded directly by the National Institute of Diabetes and Digestive and Kidney Diseases (NIDDK). Through a Data Use Agreement (DUA) process, researchers can request the USRDS data; researchers can also request the USRDS data be merged with another data source. This merge is facilitated by the USRDS. The USRDS merged their data with the DaVita data resulting in the DaVita-USRDS database that will be used for this observational study. The study cohort will consist of patients within the DaVita-USRDS database that are enrolled in Medicare Parts A, B and D (referred to as Medicare-DaVita cohort in this document).

In 2010, Medicare provided coverage to approximately 67% of US dialysis patients and DaVita provides dialysis services to more than a third of US dialysis patients. Patients in the merged DaVita-USRDS database represent approximately 22% of the US dialysis population. [Appendix 4](#) shows patient characteristics from the Medical Evidence report (CMS-2728 form) of the US dialysis population, the Medicare dialysis population, and the DaVita-USRDS cohort. Patient characteristics are similar across the three cohorts and therefore results obtained from the DaVita-USRDS cohort should be generalizable to the US dialysis population. Approximately 52% of patients in the merged cohort are < 65 years of age ([Appendix 4](#)), so this database will provide sufficient data to inform on the potential risk of GI bleeding relating to cinacalcet use in younger and older dialysis patients. Finally, feasibility analyses show that the median time on dialysis at the time of cinacalcet initiation is 4.5 ± 4.3 years with approximately 3% of patients initiating cinacalcet with one year of starting dialysis, so the inclusion criterion of at least

six months on dialysis should have little to no impact on the prevalence of cinacalcet use in the population ([Appendix 4](#)).

The DaVita data includes patient demographics, dialysis parameters, and laboratory test results. For this study, PTH, Ca, P, and albumin are the laboratory test results that will be identified from the DaVita database. All DaVita facilities use a central lab exclusively, and the test results are automatically validated and transferred to the EMR data system. Therefore, the completeness and the reliability of the lab data is expected to be high.

USRDS ESRD data are derived from an extensive national ESRD patient database, which is largely derived from the CMS Consolidated Renal Operations in a Web-enabled Network (CROWN). CROWN includes the Renal Management Information System (REMIS) and Standard Information Management System (SIMS) databases, the Enrollment Database (EDB), Medicare dialysis and hospital payment records, the CMS Medical Evidence Report (form CMS-2728), transplant data from the Organ Procurement and Transplant Network, the Death Notification (form CMS-2746), the Dialysis Facility Compare, and the Social Security Death Master File. The USRDS ESRD data also include patient medical claims: Part A institutional (inpatient, outpatient, skilled nursing facility, hospice, and home health agencies) claims and Part B physician/supplier claims, which include diagnosis codes, procedure codes, service dates, service place, etc., and Part D (oral drug prescription) claims. For this study, the information will be derived from the ESRD medical Evidence report, the ESRD Death Notification form, and Medicare Parts A, B, and D claims. Completeness of the data is not expected to be a problem as an ESRD medical Evidence report is required for every ESRD patient and an ESRD Death Notification form is required for each ESRD patient that dies. Since only patients who had Medicare as their primary payer for Parts A, B, and D are included in the database, their medical claims should be complete. For general Medicare beneficiaries, Part D data may be confounded by issues associated with being in the “donut hole” (if the total medication payment reached the lower limit of the donut hole in a given calendar year, Medicare will not reimburse for the medication until the total medication costs exceed the upper limit of the donut hole. The upper and lower limits of the donut hole change every year. However, this should not be an issue for the ESRD patients enrolled in this study. In 2014 for an example, the lower and upper limits of the donut hole were \$2850 and \$6455, respectively, but the average Medicare Part D payment in that year was \$8420,²² indicating the medication cost crossed the “donut hole” for the majority of patients. Low income subsidy (LIS) patients represent

77% of our study population and do not have a gap for drug coverage. An additional 6% of the study population are in catastrophic coverage status and also do not have a gap for drug coverage. As a result, we anticipate that the “donut hole” concern is only relevant to 17% of our study population. However, patients likely still submit claims once in the donut hole to ensure they exit out of it and based on the feasibility analysis only a small percentage of patients 3% of the non-LIS/non catastrophic population (0.05% overall) had annual cost between \$2,600 and \$2,700. Therefore, it is expected that the Medicare Part D “donut hole” should not affect the completeness of the Part D claims for this observational research study. Out-of-plan medication use is another potential concern with Medicare Part D data. However, a retrospective study in Medicare beneficiaries enrolled in Part D showed that Out-of-plan medication use accounts for a small share, 6.2%, of total prescriptions filled by Part D beneficiaries²³.

The feasibility of identifying cinacalcet use and GI bleeding is discussed in [Section 7.2.8](#).

7.4 Study Size

The outcome will be the combined events of GI bleeding hospitalization and GI bleeding death. Using the GI codes listed in the attached [Appendix 1](#), we performed a feasibility analysis on the merged DaVita-USRDS database to quantify the possible number of events using the identical inclusion and exclusion criteria for this study:

- This study will include hemodialysis patients who satisfy the following criteria in the period of 2007-2010
 - Age ≥ 18 years
 - At least 91 days on hemodialysis
 - Covered by Medicare Parts A, B, and D for at least 1 year
 - Received hemodialysis for at least 91 days in a DaVita dialysis facility
 - Parathyroid hormone (PTH) >300 pg/mL during the baseline period
 - No cinacalcet use for 365 days (baseline period)
 - No GI bleeding event for 365 days (baseline period)
- Patients will be excluded from the study for the following reasons:
 - History of parathyroidectomy (PTx)
 - Previous kidney transplant

Based on this analysis, it is anticipated that approximately 2,500 patients with an event (97.6% hospitalization for GI bleeding and 2.4% death due GI bleeding) will be identified in the study period. Matching up to 4 controls for every case, it is anticipated 11,750 patients will be included in this study. For this study, we will use a non-inferiority

(NI) design. With an NI design, the null hypothesis will be “cinacalcet is associated with a higher risk of GI bleeding events.” The alternative hypothesis will be “cinacalcet is not associated with a higher risk of GI bleeding events.” We chose 1.30 as the non-inferiority (NI) margin for the odds ratio (any cinacalcet use vs no cinacalcet use) and simulated the power to reject the null hypothesis with type I error (α) = 0.05 under varying assumptions of sample sizes and odds ratios. Choice of the NI margin depends on the balance between the benefit of the drug vs. the severity of the risk. A non-inferiority margin of 1.30 excludes a modestly increased risk of GI bleeding. Although not directly comparable, this margin has been used to exclude a modest increase in the risk of cardiovascular events in patients with diabetes.^{24,25} The table below shows the power to exclude an OR of 1.30 or greater for a range of exposure prevalence estimates, number of cases, and OR estimates for the association between cinacalcet use and GI bleeding risk. We selected conservative cinacalcet exposure prevalences ranging from 10-20% based on a previous publication evaluating cinacalcet use in the merged DaVita-USRDS database²⁶. Tables providing power calculations by age group are also provided below.

Table 2. Power to Exclude 1.30 for Various Ranges of Percent on Cinacalcet, Number of Cases, and Average Odds Ratios (overall population)

% On Cinacalcet	Number of Cases	Odds Ratio		
		1.00	1.05	1.15
10	2200	0.922	0.782	0.354
	2500	0.950	0.823	0.388
	2800	0.958	0.858	0.441
15	2200	0.973	0.890	0.470
	2500	0.989	0.932	0.534
	2800	0.995	0.965	0.574
20	2200	0.994	0.953	0.547
	2500	0.996	0.973	0.607
	2800	0.999	0.985	0.642

Given % of patients on cinacalcet, # of cases, average OR, values are powered to exclude an OR of 1.30 (NI margin).

Assumed 85% of cases are matched to 4 controls, 5% of cases are matched to 3 controls, 5% of cases are matched to 2 controls, and 5% of cases are matched to 1 control.

Table 3. Power to Exclude 1.30 for Various Ranges of Percent on Cinacalcet, Number of Cases, and Average Odds Ratios (< 65 years old)

% On Cinacalcet	Number of Cases	Odds Ratio		
		1.00	1.05	1.15
10	850	0.535	0.372	0.175
	950	0.575	0.423	0.182
	1050	0.612	0.435	0.183
15	850	0.672	0.510	0.210
	950	0.732	0.551	0.217
	1050	0.772	0.604	0.268
20	850	0.780	0.594	0.269
	950	0.822	0.657	0.286
	1050	0.859	0.716	0.294

Given % of patients on cinacalcet, # of cases, average OR, values are powered to exclude an OR of 1.30 (NI margin).

Assumed 85% of cases are matched to 4 controls, 5% of cases are matched to 3 controls, 5% of cases are matched to 2 controls, and 5% of cases are matched to 1 control.

Table 4. Power to Exclude 1.30 for Various Ranges of Percent on Cinacalcet, Number of Cases, and Average Odds Ratios (≥ 65 years old)

% On Cinacalcet	Number of Cases	Odds Ratio		
		1.00	1.05	1.15
10	1350	0.748	0.566	0.237
	1550	0.783	0.622	0.257
	1750	0.837	0.663	0.297
15	1350	0.872	0.703	0.310
	1550	0.909	0.760	0.368
	1750	0.939	0.826	0.390
20	1350	0.916	0.800	0.378
	1550	0.953	0.864	0.416
	1750	0.978	0.900	0.468

Given % of patients on cinacalcet, # of cases, average OR, values are powered to exclude an OR of 1.30 (NI margin).

Assumed 85% of cases are matched to 4 controls, 5% of cases are matched to 3 controls, 5% of cases are matched to 2 controls, and 5% of cases are matched to 1 control.

7.4.1 Obtaining Data Files

This study will use an existing linked DaVita-USRDS database. CDRG has already obtained the data under a previous data use agreement (DUA).

7.4.2 Linking Data Files

USRDS linked the DaVita data with the USRDS data. The linking process performed well, and a report from USRDS on the linked file is at DaVita.

7.4.3 Review and Verification of Data Quality

The Medicare data have been previously characterized²⁷ and widely used for observational studies.^{4,6,7} The quality of the data, especially the elements to be used, are expected to be sufficient (see [Section 7.2.8](#) and [Section 7.3](#)).

7.5 Data Analysis

7.5.1 Planned Analyses

7.5.1.1 Primary Analysis

The primary analyses will assess the potential association between any cinacalcet use and risk of GI bleeding among secondary HPT patients receiving hemodialysis.

7.5.2 Planned Method of Analysis

7.5.2.1 General Considerations

The planned analyses will follow a traditional analytic approach whereby the research team will first conduct a series of descriptive analyses to examine the demographic and clinical characteristics of the patient population according to case/control status and evaluate the odds of exposure to cinacalcet among cases and controls. Next, multivariable regression analyses will be used to evaluate the association between cinacalcet use and GI bleeding risk, with and without control for candidate confounders.

7.5.2.2 Missing or Incomplete Data

Most variables will be defined using claims data. Patients will be categorized as having a comorbidity or receiving a concomitant medication if a claim for services with an associated diagnosis or medication is present; otherwise, that patient will be categorized as not having the comorbidity or treated with the medication. This is imperfect as the absence of a claim does not necessarily mean the absence of the comorbidity or drug exposure, although in most circumstances absence of a claim does correlate with absence of condition. Therefore, by design, missing values will not occur for those variables. Age, race, sex, cause of ESRD, and time on dialysis will be defined based on information on form CMS-2728, which is collected at the initiation of dialysis; missing values for information related to these variables are very rare. If any data are missing, the corresponding patients will be excluded.

7.5.2.3 Descriptive Analysis

7.5.2.3.1 Description of Study Enrollment

The cohort entry date of a patient will be the date the patient meets all inclusion criteria for the first time in the study period. Number of patients enrolled, number of cases found, and number of patients matched with controls will be reported.

7.5.2.3.2 Description of Subject/Patient Characteristics and Exposure

The characteristics of all patients according to case/control status will be described. Patient characteristics will include age, race, sex, ESRD cause, time on dialysis, comorbid conditions, medication use, and PTH level. Percentages of patients in each variable category will be reported. Odds of exposure conditional on case and control status will be reported for each exposure definition.

7.5.2.4 Analysis of Objectives

Conditional logistic regressions²⁸ will be used to estimate the OR for the association between cinacalcet use (ie, any cinacalcet use, past cinacalcet use, current cinacalcet use, cumulative exposure, and cumulative dose) and the risk of GI bleeding. All matching variables and each of the comorbid conditions and medications listed will be included in the model (by convention).

Extensive lists of comorbid conditions and medications ([Appendix 5](#) and [Appendix 6](#)) were developed by an expert panel based on literature and their experience. The medications were categorized based on their function and use. The 2009 and 2010 national dialysis cohort with one year follow-up was used to determine which comorbidity and medication should be used in the model for this study. A Cox regression model was fit with all variables described in [Section 7.2.7](#) in the model. The LASSO approach was used with optimal cross-validation as the variable selection criterion. Based on this validation process, low albumin and GI inflammation were excluded from the adjusting variable list for the analyses in this study.

7.5.2.5 Sensitivity Analysis

7.5.2.5.1 Subgroup Analysis

As a subgroup analysis, the model will be run for patients aged < 65 and ≥ 65 years, separately. The group will be determined by the age of cases. For the match, +/- 1 year difference for age will be allowed. We will conduct additional subgroup analysis for patients based on sex, race, time on dialysis (including for patients with less than 1 year time on dialysis), and baseline parathyroid hormone levels.

7.5.2.5.2 Sensitivity Analysis

7.5.2.5.2.1 Incorporating Competing Event

A sensitivity analysis will be conducted with death as the competing event due to a higher death rate among dialysis patients compared to the rates of a GI bleeding event (death and hospitalization). The sensitivity analysis will be done for all exposure groups. The sub-distribution density sampling will be used to incorporate competing risks.^{29,30}

The competing event for this analysis is death. Similar to the Fine-Gray model, in this analysis, death without GI bleeding will be ignored and we will assume patients will not experience a GI bleed following the death date. We will set the time of the competing event (death) in the cohort to “infinity” and will perform the incidence density sampling with the modified data. We will assume that the exposure status at the time of death remains constant for the “added” follow-up time and rerun the analyses for current use, past use, and any use.

7.5.2.5.2.2 Varying Exposure Definitions

Current use will be evaluated during the 61 days preceding the index date. A sensitivity analysis will be performed to assess use in fixed, discreet windows. We will assess patients with cinacalcet use during the 61-120 days prior to the index date, excluding patients with use within the 60 days prior the index date, and compare these patients to patients with no cinacalcet use. We will also assess patients with cinacalcet exposure during 121-180 days prior to the index date, excluding patients with use during the 0-120 days prior the index date, and compare this group with the no cinacalcet use group. Additional sensitivity analyses will be conducted for the exposure window 181-365 days before the index date. We will also assess the risk of GI bleeding among patients with any cinacalcet use during the 365 days prior to the index date compared to patients with no use.

7.5.2.5.2.3 Individual Outcomes

A sensitivity analysis will be conducted to assess the association between cinacalcet use and hospitalization due to GI bleeding, and separately, death due to GI bleeding.

7.5.3 Analysis of Safety Endpoint(s)/Outcome(s)

Outcomes of GI bleeding and fatal GI bleeding will be analyzed.

7.6 Quality Control

Independent production and quality control programming will be performed for all analyses.

7.7 Limitations of the Research Methods

7.7.1 Internal Validity of Study Design

Not applicable.

7.7.1.1 Measurement Error(s)/Misclassification(s)

The primary outcome is hospitalization for GI bleeding or death due to GI bleeding. As discussed in [Section 7.2.7](#), information on GI bleeding hospitalization events and deaths due to GI bleeding are expected to have high sensitivity and specificity.

The exposure will be defined from Medicare Part D claims. Because the data reported in claims are payment related, the information are reliable (see details in [Sections 7.2.8](#) and [Section 7.3](#)).

7.7.1.2 Information Bias

Information on all comorbid conditions will be derived from medical claims. “No” will be defined as absence of claims with corresponding diagnosis codes. So, “No” means “not diagnosed”, which may not be same as “no disease”.

7.7.1.3 Selection Bias

The data presented in [Appendix 4](#) show that the patient characteristics of patients included in the DaVita-USRDS merged file are comparable to the larger Medicare and DaVita populations, suggesting that selection bias should not be a concern.

7.7.1.4 Confounding

Based on review of the literature and discussions with experts in the management of secondary HPT, it is expected that all potential confounding variables that can be derived from dialysis EMR and claims data have been included and will be controlled. However, unmeasured confounding cannot be ruled out.

7.7.2 External Validity of Study Design

DaVita dialysis units account for one third of the ESRD patients in the United States and the characteristics of patients at these units are representative of the national dialysis population. Findings should be generalizable to all dialysis patients.

7.7.3 Analysis Limitations

Through the study design, selection of exposure windows, case/control definitions, and assessment of confounders, the possibility of residual confounding has been minimized; however, as with most non-interventional drug safety studies, it may not be possible to rule out residual confounding completely.

7.7.4 Limitations due to Missing Data and/or Incomplete Data

Missing patient information is rare in the USRDS ESRD database. This should not be a major concern for this study.

8. Protection of Human Subjects

This study uses de-identified data.

9. Collection of Safety Information and Product Complaints

Reporting of individual adverse events is not applicable for secondary data analysis studies.

10. Administrative and Legal Obligations

10.1 Protocol Amendments and Study Termination

Amgen may amend the protocol at any time. Amgen reserves the right to terminate the study at any time. Both Amgen and the Investigator reserve the right to terminate the Investigator's participation in the study according to the contractual agreement.

11. Plans for Disseminating and Communicating Study Results

11.1 Publication Policy

The results of the study will be submitted for publication. Authorship of any publications resulting from this study will be determined on the basis of the International Committee of Medical Journal Editors (ICJME) Recommendations for the Conduct, Reporting, Editing and Publication of Scholarly Work in Medical Journals, which states:

Authorship credit should be based on (1) substantial contributions to conception and design, acquisition of data, or analysis and interpretation of data; (2) drafting the article or revising it critically for important intellectual content; (3) final approval of the version to be published and (4) agreement to be accountable for all aspects of the work in ensuring that questions related to the accuracy or integrity of any part of the work are appropriately investigated and resolved. Authors should meet conditions 1, 2, 3 and 4 above.

- When a large, multicenter group has conducted the work, the group should identify the individuals who accept direct responsibility for the manuscript. These individuals should fully meet the criteria for authorship defined above.
- Acquisition of funding, collection of data, or general supervision of the research group, alone, does not justify authorship.
- All persons designated as authors should qualify for authorship, and all those who qualify should be listed.
- Each author should have participated sufficiently in the work to take public responsibility for appropriate portions of the content.

All publications (eg, manuscripts, abstracts, oral/slide presentations, book chapters) based on this study must be submitted to Amgen for corporate review. The vendor agreement will detail the procedures for, and timing of, Amgen's review of publications.

13. Appendices

Appendix 1. ICD-9-CM Codes to Identify GI Bleeding

ICD-9-CM description	ICD-9-CM code
Gastroesophageal laceration-hemorrhage syndrome	5307
Acute gastric ulcer with hemorrhage, without mention of obstruction	53100
Acute gastric ulcer with hemorrhage, with obstruction	53101
Acute gastric ulcer with hemorrhage and perforation, with obstruction	53121
Acute gastric ulcer with hemorrhage and perforation, without mention of obstruction	53120
Chronic or unspecified gastric ulcer with hemorrhage, with obstruction	53141
Chronic or unspecified gastric ulcer with hemorrhage, without mention of obstruction	53140
Chronic or unspecified gastric ulcer with hemorrhage and perforation, with obstruction	53161
Chronic or unspecified gastric ulcer with hemorrhage and perforation, without mention of obstruction	53160
Acute duodenal ulcer with hemorrhage, without mention of obstruction	53200
Acute duodenal ulcer with hemorrhage, with obstruction	53201
Acute duodenal ulcer with hemorrhage and perforation, without mention of obstruction	53220
Acute duodenal ulcer with hemorrhage and perforation, with obstruction	53221
Chronic or unspecified duodenal ulcer with hemorrhage, without mention of obstruction	53240
Chronic or unspecified duodenal ulcer with hemorrhage, with obstruction	53241
Chronic or unspecified duodenal ulcer with hemorrhage and perforation, without mention of obstruction	53260
Chronic or unspecified duodenal ulcer with hemorrhage and perforation, with obstruction	53261
Acute peptic ulcer of unspecified site with hemorrhage, without mention of obstruction	53300
Acute peptic ulcer of unspecified site with hemorrhage, with obstruction	53301
Acute peptic ulcer of unspecified site with hemorrhage and perforation, without mention of obstruction	53320
Acute peptic ulcer of unspecified site with hemorrhage and perforation, with obstruction	53321
Chronic or unspecified peptic ulcer of unspecified site with hemorrhage, without mention of obstruction	53340
Chronic or unspecified peptic ulcer of unspecified site with hemorrhage, with obstruction	53341
Chronic or unspecified peptic ulcer of unspecified site with hemorrhage and perforation, without mention of obstruction	53360
Chronic or unspecified peptic ulcer of unspecified site with hemorrhage and perforation, with obstruction	53361
Acute gastrojejunal ulcer with hemorrhage, without mention of obstruction	53400
Acute gastrojejunal ulcer, with hemorrhage, with obstruction	53401
Acute gastrojejunal ulcer with hemorrhage and perforation, without mention of obstruction	53420
Acute gastrojejunal ulcer with hemorrhage and perforation, with obstruction	53421

ICD-9-CM description	ICD-9-CM code
Chronic or unspecified gastrojejunal ulcer with hemorrhage, without mention of obstruction	53440
Chronic or unspecified gastrojejunal ulcer, with hemorrhage, with obstruction	53441
Chronic or unspecified gastrojejunal ulcer with hemorrhage and perforation, without mention of obstruction	53460
Chronic or unspecified gastrojejunal ulcer with hemorrhage and perforation, with obstruction	53461

Hematemesis	5780
Blood in stool	5781
Hemorrhage of gastrointestinal tract, unspecified	5789
Acute gastritis, with hemorrhage	53501
Atrophic gastritis, with hemorrhage	53511
Gastric mucosal hypertrophy, with hemorrhage	53521
Alcoholic gastritis, with hemorrhage	53531
Other specified gastritis, with hemorrhage	53541
Unspecified gastritis and gastroduodenitis, with hemorrhage	53551
Duodenitis, with hemorrhage	53561
Eosinophilic gastritis, with hemorrhage	53571
Angiodysplasia of stomach and duodenum with hemorrhage	53783
Dieulafoy lesion (hemorrhagic) of stomach and duodenum	53784
Diverticulosis of small intestine with hemorrhage	56202
Diverticulitis of small intestine with hemorrhage	56203
Diverticulosis of colon with hemorrhage	56212
Diverticulitis of colon with hemorrhage	56213
Hemoperitoneum	56881
Esophageal hemorrhage	53082
Ulcer of esophagus with bleeding	53021
Dieulafoy lesion (hemorrhagic) of intestine	56986
Esophageal varices with bleeding	4560
Esophageal varices in diseases classified elsewhere, with bleeding	45620
Internal hemorrhoids with other complication	4552
External hemorrhoids with other complication	4555
Unspecified hemorrhoids with other complication	4558

Appendix 2. NDC Codes for Cinacalcet

NDC	Product_Name	Generic_Name
54868561600	SENSIPAR	CINACALCET HCL TAB 30 MG (BASE EQUIV)
55513007301	SENSIPAR	CINACALCET HYDROCHLORIDE
55513007330	SENSIPAR	CINACALCET HCL TAB 30 MG (BASE EQUIV)
55513007401	SENSIPAR	CINACALCET HYDROCHLORIDE
55513007430	SENSIPAR	CINACALCET HCL TAB 60 MG (BASE EQUIV)
55513007501	SENSIPAR	CINACALCET HYDROCHLORIDE
55513007530	SENSIPAR	CINACALCET HCL TAB 90 MG (BASE EQUIV)

Appendix 3. The 10 Medicare Geographic Regions

CMS Region	States in Region
1	Connecticut, Maine, Massachusetts, New Hampshire, Rhode Island, Vermont
2	New Jersey, New York, Puerto Rico, Virgin Islands
3	Delaware, District of Columbia, Maryland, Pennsylvania, Virginia, West Virginia
4	Alabama, Florida, Georgia, Kentucky, Mississippi, North Carolina, South Carolina, Tennessee
5	Illinois, Indiana, Michigan, Minnesota, Ohio, Wisconsin
6	Arkansas, Louisiana, New Mexico, Oklahoma, Texas
7	Iowa, Kansas, Missouri, Nebraska
8	Colorado, Montana, North Dakota, South Dakota, Utah, Wyoming
9	Arizona, California, Hawaii, Nevada, Pacific Territories
10	Alaska, Idaho, Oregon, Washington

Appendix 4. Patient Characteristics of 2010 US Dialysis Population, the US Medicare Dialysis Population, and the DaVita-USRDS Medicare Dialysis Population

Variables	Dialysis Patients		
	ALL	Medicare	Medicare-DaVita
Overall	452702(100.00)	303728(100.00)	98891(100.00)
Age; Mean(SD)	62.11(15.17)	63.15(14.93)	62.64(14.80)
Age category			
<18	1764(0.39)	738(0.24)	65(0.07)
18-<25 yrs	3903(0.86)	2080(0.68)	760(0.77)
25-<45 yrs	52245(11.54)	32323(10.64)	11213(11.34)
45-<65 yrs	185986(41.08)	117144(38.57)	38906(39.34)
65-<75 yrs	106012(23.42)	76374(25.15)	24831(25.11)
75-<85 yrs	79073(17.47)	57511(18.94)	17955(18.16)
85+ yrs	23719(5.24)	17558(5.78)	5161(5.22)
Race			
White	264148(58.35)	177255(58.36)	56164(56.79)
Black	158122(34.93)	109108(35.92)	37282(37.70)
Asian	22714(5.02)	12026(3.96)	3753(3.80)
Native American	5630(1.24)	4215(1.39)	1502(1.52)
Other/Unknown race	2088(0.46)	1124(0.37)	190(0.19)
Gender			
Male	250866(55.42)	167372(55.11)	55009(55.63)
Female	201738(44.56)	136315(44.88)	43874(44.37)
Unknown gender	98(0.02)	41(0.01)	*
Ethnicity			
Non-hispanic	375068(82.85)	257180(84.67)	83887(84.83)
Hispanic	75321(16.64)	45632(15.02)	14925(15.09)
Unknown/Missing ethnicity	2313(0.51)	916(0.30)	79(0.08)
Primary Cause of ESRD			
Diabetes	205428(45.38)	138980(45.76)	45620(46.13)
Hypertension	129498(28.61)	89616(29.51)	29412(29.74)
Glomerulonephritis	46929(10.37)	30100(9.91)	9851(9.96)
Other/Missing/Unknown cause	70847(15.65)	45032(14.83)	14008(14.17)
Medicare Coverage at Initiation			
Medicare	213844(47.24)	166877(54.94)	52961(53.55)
Medicaid	118016(26.07)	85398(28.12)	27901(28.21)
Employment based Ins.	112190(24.78)	60976(20.08)	21315(21.55)

Inability to Transfer	7920(1.75)	5481(1.80)	1396(1.41)
Dialysis Duration			
<1 yr	163797(36.18)	95939(31.59)	31009(31.36)
1-<3 yrs	121977(26.94)	80056(26.36)	26210(26.50)
3-<5 yrs	74057(16.36)	58188(19.16)	19467(19.69)
5+ yrs	92871(20.51)	69545(22.90)	22205(22.45)

Appendix 5. Comorbid Conditions for NCC Project (ICD-9)

Comorbidity	ICD-9	
HDL	2727, 2720, 2721, 2722, 2723, 2724, 2725, 2728, 2729, 2726	
Necrosis (Liver)	570	
Hepatitis (Liver)	5710, 5711, 57141, 57149, 57140, 57142, 5731, 5732, 5733, 07052, 07051, 07053, 07059, 07054, 07059, 05471, 0700, 0701, 07021, 07031, 07020, 07030, 07041, 07053, 07049, 07059, 0709, 07033, 07032, 07054, 0706, 07030, 07020, 07070, 07071, 0709, 0785, 5731, 07271, 1305, 5739	
Cirrhosis (Liver)	5712, 5713, 5715, 5719, 5716, 5715, 5718, 5719, 5724, 5728	
Asthma (Lung)	49310, 49300, 49302, 49312, 49301, 49311, 49392, 49391, 49390, 49382, 4950, 4951, 4952, 4953, 4954, 4955, 4956, 4957, 4958, 4959, 5183	
COPD (Lung)	4910, 4911, 4918, 4919, 49122, 49121, 49120, 4928, 4920, 49321, 49322, 49320, 4941, 4940, 496, 5181, 5182, 4941	
GI Cancer	150.xx, 151.xx, 152.xx, 153.xx, 154.0x, 154.1x, 230.0x, 230.1x, 230.2x, 230.3x, 230.4x, 230.5x, 230.6x, 230.7x, 230.8x, 230.9x, 159.xx	
Hematologic Cancer	204.0x, 205.00, 205.01, 205.02, 205.3x, 206.0x, 207.0x, 207.2x, 208.0x, 204.1x, 205.1x, 200.0x, 200.1x, 200.2x, 200.3x, 200.4x, 200.5x, 200.6x, 200.7x, 200.8x, 201.xx, 202.0x, 202.1x, 202.2x, 202.4x, 202.7x, 202.80, 202.81, 202.82, 202.83, 202.84, 202.85, 202.86, 202.87, 202.88, 203.80, 203.82, 273.3x, 203.0x, 203.1x, 203.81, 205.2x, 208.1x, 206.1x, 208.2x, 208.8x, 208.9x, 204.9x, 238.72, 238.73, 238.74, 238.75, 206.2x, 206.9x, 205.9x, 202.3x, 202.5x, 202.6x, 202.9x, 204.2x, 204.8x, 206.8x, 205.8x, 207.8x	
Solid tumor Cancer	154.2x, 154.3x, 154.8x, 188.xx, 189.1x, 189.2x, 189.3x, 189.4x, 189.8x, 189.9x, 174.xx, 175.xx, 191.xx, 192.0x, 192.1x, 192.2x, 192.3x, 192.8x, 192.9x, 193.xx, 194.0x, 194.1x, 194.3x, 194.4x, 194.5x, 194.6x, 194.8x, 194.9x, 209.0x, 209.1x, 209.2x, 209.30, 179.xx, 180.xx, 182.xx, 184.0x, 184.1x, 184.2x, 184.3x, 184.4x, 140.xx, 141.0x, 141.1x, 141.2x, 141.3x, 141.4x, 141.5x, 141.6x, 141.8x, 141.9x, 142.0x, 142.1x, 142.2x, 142.8x, 142.9x, 143.xx, 144.xx, 145.0x, 145.1x, 145.2x, 145.3x, 145.4x, 145.5x, 145.6x, 145.8x, 145.9x, 146.0x, 146.1x, 146.2x, 146.3x, 146.4x, 146.5x, 146.6x, 146.7x, 146.8x, 146.9x, 147.xx, 148.0x, 148.1x, 148.2x, 148.3x, 148.8x, 148.9x, 149.xx, 160.0x, 160.1x, 160.2x, 160.3x, 160.4x, 160.5x, 160.8x, 160.9x, 161.xx, 162.0x, 190.xx, 195.0x, 189.0x, 155.xx, 156.0x, 156.1x, 156.2x, 156.8x, 156.9x, 162.2x, 162.3x, 162.4x, 162.5x, 162.8x, 162.9x, 165.xx, 172.xx, 183.0x, 157.xx, 185.xx, 233.0x, 233.1x, 231.xx, 233.2x, 233.3x, 233.4x,	

Comorbidity	ICD-9	
	233.5x, 233.6x, 233.7x, 233.9x, 234.xx, 232.xx, 176.xx, 195.2x, 170.4x, 170.5x, 170.7x, 170.8x, 170.0x, 170.1x, 170.2x, 170.3x, 170.6x, 170.9x, 163.xx, 164.1x, 164.2x, 164.3x, 164.8x, 164.9x, 195.5x, 183.2x, 183.3x, 183.4x, 183.5x, 183.8x, 183.9x, 184.8x, 184.9x, 195.8x, 195.3x, 187.1x, 187.2x, 187.3x, 187.4x, 187.5x, 187.6x, 187.7x, 187.8x, 187.9x, 171.0x, 171.2x, 171.3x, 171.4x, 171.5x, 171.6x, 171.7x, 171.8x, 171.9x, 181.xx, 158.xx, 186.xx, 195.1x, 164.0x, 195.4x, 199.xx, 209.31, 209.32, 209.33, 209.34, 209.35, 209.36, 173.xx	
Systolic HF	42820, 42821, 42822, 42823, 42840, 42841, 42842, 42843	
HF	40201, 40211, 40291, 40401, 40411, 40491, 40403, 40413, 40493, 4280, 42830, 42831, 42832, 42833, 4289	
DM	25011, 25013, 25033, 25031, 25043, 25041, 25053, 25051, 25063, 25061, 25071, 25073, 25081, 25083, 25003, 25093, 25023, 25033, 25021, 25093, 25091, 25001, 25022, 25020, 25032, 25042, 25040, 25050, 25052, 25060, 25062, 25070, 25072, 25080, 36205, 36206, 36202, 25030, 25080, 25042, 25012, 25002, 25032, 25022, 25082, 25062, 25080, 25092, 25052, 25072, 25082, 25012, 25010, 25080, 25090, 25092, 25000, 25010, 25012, 3572, 36207, 36201, 36204, 36203, 36205, 36206, 36202, 36641, 24920, 24910, 24930, 24940, 24950, 24970, 24960, 24980, 24930, 24990, 24900	
CVD	430, 431, 436, 4320, 4321, 4329, 4350, 4351, 4352, 4353, 4358, 4359, 4370, 4371, 4372, 4373, 4374, 4375, 4376, 4377, 4378, 4379, 4380, 4386, 4387, 4389, 43300, 43301, 43310, 43311, 43320, 43321, 43330, 43331, 43380, 43381, 43390, 43391, 43401, 43411, 43491, 43810, 43811, 43812, 43813, 43814, 43819, 43820, 43821, 43822, 43830, 43831, 43832, 43840, 43841, 43842, 43850, 43851, 43852, 43853, 43881, 43882, 43883, 43884, 43885, 43889, 43889, 44329, 36234	
Thrombocytopenia	28730, 28739, 28749, 2875	
Low serum albumin	79099, 2738	
Calciophylaxis	27549	
CAD (diagnosis)	4131, 4130, 4139, 41400, 41401, 41419, 41410, 41411, 41412, 4148, 41405, 41403, 41402, 41404, 41406, 41407, 4142, 4143, 4144, 4148, 4149, 42979, 4292, 42971	Keep these two (CAD) in one comorbid condition
CAD (procedure codes)	3603, 3604, 3609, 3606, 3607, 3610, 0066, 3611, 3612, 3613, 3614, 3615, 3616, 3617, 3619, 3639	

Comorbidity	ICD-9	
PVD (diagnosis)	4401, 44020, 44021, 44022, 44023, 44024, 44029, 44030, 44031, 44032, 4408, 4409, 4404, 44401, 44409, 4414, 4400, 44100, 44101, 44102, 44103, 4411, 4412, 4413, 4414, 4416, 4417, 4415, 4419, 4441, 4419, 44281, 4420, 4421, 4422, 4423, 44282, 44283, 44289, 4429, 44329, 4430, 4431, 44382, 44389, 4439, 44321, 44322, 44323, 44324, 44329, 44381, 44401, 44409, 4441, 44409, 44421, 44422, 44481, 44489, 4449, 44501, 44502, 44581, 44589, 4470, 4471, 4472, 4473, 4478, 4474, 4476, 44771, 44772, 44773, 44770, 4478, 4479, 4475, 4510, 45111, 45181, 45119, 4512, 45189, 4519, 4530, 4531, 4532, 45387, 45377, 4533, 45340, 45341, 45342, 45350, 45351, 45352, 45350, 45351, 45352, 45383, 45381, 45382, 45373, 45371, 45372, 4536, 45389, 45379, 45384, 45374, 45385, 45375, 45386, 45376, 4150, 41512, 41513, 41519, 5570, 5571, 5579	Keep these three (PVD) in one comorbid condition
PVD (procedure codes)	84.0, 84.1, 84.91, 39.25, 39.26, 39.29, 00.55, 39.50, 39.90	
PVD (CPT)	24900, 24920, 25900, 25905, 25920, 25927, 27295, 27590, 27591, 27592, 27598, 27880, 27881, 27882, 27888, 27889, 28800, 28805, 34900, 35131, 35132, 35141, 35142, 35151, 35152, 34051, 34151, 34201, 34203, 34800–34834, 35081–35103, 35331, 35341, 35351, 35355, 35361, 35363, 35371, 35372, 35381, 35450, 35452, 35454, 35456, 35459, 35470, 35471, 35472, 35473, 35474, 35480, 35481, 35482, 35483, 35485, 35490, 35491, 35492, 35493, 35495, 35521, 35531, 35533, 35541, 35546, 35548, 35549, 35551, 35556, 35558, 35563, 35565, 35566, 35571, 35583, 35585, 35587, 35621, 35623, 35646, 35647, 35651, 35654, 35656, 35661, 35663, 35665, 35666, 35671	
GI (inflammatory)	5550, 5609, 56981, 5551, 5552, 5559, 5641, 5566, 5562, 5568, 5569, 538, 5560, 5561, 5565, 5563, 56981, 566, 56941, 56982	
GI (diverticula)	5371, 56201, 56203, 56200, 56202, 56201, 56203, 56211, 56213, 56210, 56212, 7504, 7510, 5306, 5695	
GI (lower)	56984, 56985, 56949, 56941, 56982, 56981, 56089, 5582, 5583, 78791, 55841, 55842, 5589, 5570, 5571, 5579, 5601, 5600, 5602, 56031, 56032, 56030, 56039, 56081, 5609, 56400, 56401, 56402, 56409, 56481, 5647, 5646, 56489, 5649, 5650, 5691, 5692, 5693, 56949, 56943, 56944, 56942, 56949, 56983, 56989, 2113, 56986, 0090, 0091, 0092, 0093, 4550, 4551, 4552, 4555, 4556, 4557, 4558, 4553, 4559, 4554, 4557, 5564, 5690	
GI (upper)	53200, 53210, 53220, 53230, 53240, 53250, 53260, 53270, 53290, 53560, 53561, 53100, 53110, 53120, 53130, 53140, 53150, 53160, 53170, 53190, 53500, 53501, 53530, 53531, 53510, 53540, 53511, 53541, 53511, 53520, 53540, 53521, 53541, 53550, 53551, 53400, 53410, 53420, 53430, 53440, 53450, 53460,	

Comorbidity	ICD-9	
	53470, 53490, 53300, 53310, 53320, 53340, 53350, 53360, 53370, 53390, 53011, 53081, 5307, 53783, 53782, 5581, 53013, 53019, 53010, 53012, 5303, 53085, 53082, 53083, 5309, 53089, 5368, 5370, 5376, 5373, 5374, 5360, 5363, 53789, 5369, 5379, 7871, 53570, 53571, 53020, 53021, 4561, 4560, 45621, 45620, 2111	
GI (surgery) Procedure codes	4542, 1731, 1739, 4541, 4550, 4552, 4571, 4579, 4604, 4255, 4256, 5265, 4266, 4268, 4269, 4463, 4500, 4503, 4543, 4549, 4573, 4575, 4579, 4581, 4582, 4583, 4650, 4652, 4674, 4675, 4676, 4679, 4685, 4686, 4687, 4692, 4694, 4699, 527, 5783, 7072, 9608, 9624, 9804, 9818, 4253, 4263, 4502, 4533, 4534, 4561, 4563, 4673, 4674, 4651, 4602, 4693, 5132, 5137, 9803	
Alcohol	30500, 30501, 30502, 2910, 29189, 2915, 2913, 29182, 2919, 30390, 30391, 30392, 30300, 30301, 30302, 29181, 2913, 2911, 2912, 2914	
Tobacco use	3051, 98984

Amendment 3

Protocol Title: An Observational Study to Evaluate the Potential Association Between Cinacalcet and Gastrointestinal Bleeding

Amgen Protocol Number 20170171

Amendment Date: 12 February 2018

Rationale:

ORRG approved the original Protocol Number 20170171 on 23 June 2017. The protocol was submitted to the Food and Drug Administration (FDA) to address PSP/PMR 3202-1. Amendments 1 (dated 20 October 2017) and 2 (dated 5 December 2017) were issued to address feedback received from the FDA. One minor edit (Amendment 3) was made on 12 February 2018 to address a comment from the FDA per correspondence dated 26 January 2018.

Description of Changes:

Section: [Summary Table of Study Protocol](#)

Replace:

Title	An Observational Study to Evaluate the Potential Association Between Cinacalcet and Gastrointestinal Bleeding
Date of last version of the protocol	05 December 2017, Amendment 2

With:

Title	An Observational Study to Evaluate the Potential Association Between Cinacalcet and Gastrointestinal Bleeding
Date of last version of the protocol	12 February 2018, Amendment 3

Section: [Investigator Agreement](#)

Replace:

I have read the attached protocol entitled 'An Observational Study to Evaluate the Potential Association Between Cinacalcet and Gastrointestinal Bleeding' dated 05 December 2017 and agree to abide by all provisions set forth therein.

I agree to ensure that the confidential information contained in this document will not be used for any purpose other than the evaluation or conduct of the clinical investigation without the prior written consent of Amgen Inc.

Section: 5.3 Statistical Inference (Hypothesis)

Replace:

The hypothesis test is as follows:

H₀: Cinacalcet use is associated with a 30% or more increased risk (OR=1.30) of fatal and non-fatal GI bleeding

H₁: Cinacalcet use is not associated with a less than 30% increased risk of fatal and non-fatal GI bleeding

Our choice for a non-inferiority margin, OR=1.30, indicates that an observed upper confidence limit below 1.30 would result in the rejection of the null hypothesis and the conclusion that cinacalcet is associated with a less than 30% increased risk of GI bleeds. If our confidence limit includes 1.30, it indicates that we cannot reject the null. Based on our preliminary analysis, the anticipated GI bleeding event numbers will be sufficient for a statistical hypothesis test at a NI margin of 1.30. This margin has been used to understand risk of cardiovascular events in patients with diabetes and we think it is reasonable to apply a similar parameter in our setting.

With:

The hypothesis test is as follows:

H₀: Cinacalcet use is associated with a 30% or more increased risk (OR=1.30) of fatal and non-fatal GI bleeding

H₁: Cinacalcet use is associated with a less than 30% increased risk of fatal and non-fatal GI bleeding

Our choice for a non-inferiority margin, OR=1.30, indicates that an observed upper confidence limit below 1.30 would result in the rejection of the null hypothesis and the

conclusion that cinacalcet is associated with a less than 30% increased risk of GI bleeds. If our confidence limit includes 1.30, it indicates that we cannot reject the null. Based on our preliminary analysis, the anticipated GI bleeding event numbers will be sufficient for a statistical hypothesis test at a NI margin of 1.30. This margin has been used to understand risk of cardiovascular events in patients with diabetes and we think it is reasonable to apply a similar parameter in our setting.
