Data analysis plan

Rapid Data Analysis – Systemic fluoroquinolones and thrombotic thrombocytopenic purpura (TTP)

Contact for data analysis	
Contact mailbox	ICU@ema.europa.eu
Date	9 June 2021

Request	
Affiliation	Norwegian Medicines Agency

Background	
Short title of topic	Systemic fluoroquinolones and thrombotic thrombocytopenic purpura (TTP)
Regulatory procedure	Signal procedure (EPITT no. 19669)
Background	<p>The signal originates from a review of case reports within EudraVigilance and signal detection based on disproportionality.</p> <p>The review identified 5 well documented literature reports of TTP for ciprofloxacin. The time to onset was <21 days (4 days, 5 days and 13 days). None of the patients had a history of malignancy or haematopoietic stem cell transplantation. Other known precipitating factors were also excluded.</p> <p>TTP is considered an ultraorphan disease with an incidence rate of 2.1 per million.</p> <p>TTP is listed in the USPI for Cipro®, and the SmPC for the innovator Ciproxin® lists several manifestations of TTP (thrombocytopenia, haemolytic anaemia, convulsions, and confusion).</p>

Background

Description of research question	Is there evidence of an association between systemic fluoroquinolones and acquired TTP?
----------------------------------	---

1. List of abbreviations

<i>MAH</i>	<i>Marketing Authorisation Holder</i>

<i>PRAC</i>	<i>Pharmacovigilance Risk Assessment Committee</i>
<i>RDA</i>	<i>Rapid Data Analysis</i>

2. Rationale and background

Fluoroquinolone antibiotics act by inhibiting enzymes involved in bacterial DNA synthesis.

Fluoroquinolones have been used since the 1980s as broad-spectrum antibiotics with low propensity for development of antibiotic resistance.

Immune-mediated thrombocytopenia is a known rare adverse reaction to fluoroquinolones [1-5]

Thrombotic thrombocytopenic purpura (TTP) is a rare disease that is associated with microangiopathy, haemolytic anaemia, thrombosis and thrombocytopenia. Although the exact cause of TTP is not known it is associated with a deficiency of the von Willebrand factor cleaving protease ADAMTS13, allowing large complexes of van Willebrand factor to circulate in the blood. TTP exists in a congenital form and in an acquired form. The acquired form is caused by antibody to ADAMTS13.

The signal originates from a review of case reports within EudraVigilance and signal detection based on disproportionality.

The review identified 5 well documented literature reports of TTP for ciprofloxacin. The time to onset was <21 days (4 days, 5 days and 13 days). None of the patients had a history of malignancy or haematopoietic stem cell transplantation. Other known precipitating factors were also excluded.

TTP is considered an ultraorphan disease with an incidence rate of 2.1 per million.

TTP is listed in the USPI for Cipro®, and the SmPC for the innovator Ciproxin® lists several manifestations of TTP (thrombocytopenia, haemolytic anaemia, convulsions, and confusion).

3. Research question and objectives

Is there evidence of an association between systemic fluoroquinolones and acquired TTP, i.e. is there an increased frequency of acquired TTP following treatment with fluoroquinolones?

4. Research methods

4.1. Study design

A descriptive comparative incident cohort design is proposed where the incidence of TTP in patients initiating systemic fluoroquinolone treatment is compared to broad spectrum penicillins. A separate analysis will compare patients initiating systemic fluoroquinolones to patients initiating azithromycin.

We will identify patients with a first prescription for either a systemic fluoroquinolone or a systemic broad-spectrum penicillin (or azithromycin) and a minimum look-back period of at least one year at the time of the first prescription. Only the first prescription date for either of the two types of antibiotics will be considered. Patients with a concomitant first prescription for both a systemic fluoroquinolone

and a systemic broad-spectrum penicillin (or azithromycin), and patients with a history of TTP will not be considered.

The patients will then be followed for a maximum of 30 days (a sensitivity analysis will follow patients up to 60 days) and any occurrence of TTP during this time period will be recorded. (The 60-day sensitivity analysis will be done to allow time for the recording of what is a secondary care diagnosis in the primary care databases.) Patients with a history of HIV, disseminated intravascular coagulation (DIC) or haemolytic-uremic syndrome (HUS) will be excluded as these conditions can lead to TTP. The follow-up of the patients will end at the earliest of:

- A TTP outcome event
- End of follow-up (30 or 60 days)
- Use of the alternative treatment (from a fluoroquinolone to a broad-spectrum penicillin and vice versa)
- Occurrence of HIV, DIC or HUS
- End of observation (patient no longer observable in the database)

4.2. Setting

The proposed settings are GP practices (in IMRD-UK) and GP and specialist practices (in IMS® Disease Analyzer Germany).

4.3. Variables

4.3.1. Exposure variables

4.3.1.1. Systemic fluoroquinolones

Systemic fluoroquinolones (oral, parenteral, inhalation) in WHO ATC class J01MA (Fluoroquinolones) will be included. In IMS® Disease Analyzer Germany medicines the relevant products can be identified using the EphMRA ATC code J01G (systemic fluoroquinolones). In IMRD-UK systemic fluoroquinolones can be identified by ATC class (J01M A) and by search generic drug names in the database.

The list of identified systemic fluoroquinolone products in IMS® Disease Analyzer Germany can be found in Annex 1. The list of identified systemic fluoroquinolone products in IMRD-UK can be found in Annex 2.

4.3.1.2. Systemic broad-spectrum penicillins

Systemic broad-spectrum penicillins in WHO ATC class J01CA and J01CR (Combinations of penicillins, including beta-lactamase inhibitors) will be included. In IMS® Disease Analyzer Germany medicines the relevant products can be identified using the EphMRA ATC code J01C (broad spectrum penicillins). In IMRD-UK systemic broad-spectrum penicillins can be identified using ATC code "J01C A" OR "J01C R".

The list of identified systemic broad-spectrum penicillins in IMS® Disease Analyzer Germany can be found in Annex 3. The list of identified systemic broad-spectrum penicillin products in IMRD-UK can be found in Annex 4.

4.3.1.3. Azithromycin

Systemic azithromycin with the WHO code J01FA10 will be included. In IMS® Disease Analyzer Germany medicines the relevant products can be identified using the EphMRA ATC code J01F (macrolides and similar types) and selecting the molecule 'azithromycin'. In IMRD-UK systemic broad-spectrum penicillins can be identified using ATC code "J01F A10".

4.3.2. Outcome variables

TTP will be identified using ICD 10 code M31.1 (Thrombotic microangiopathy) in IMS® Disease Analyzer Germany. In a sensitivity analysis, the ICD10 code D59.4 (Other nonautoimmune haemolytic anaemias) will be added to this.

In IMRD-UK TTP will be identified through the use of Read codes corresponding to ICD10 code M31.1:

G756.00 "Thrombotic microangiopathy";
G756000 "Moschcowitz syndrome";
G756100 "Thrombotic thrombocytopenic purpura";
G756z00 "Thrombotic microangiopathy NOS"

In a sensitivity analysis, Read codes corresponding to ICD10 code D59.4 will also be included:

D111.00 Non-autoimmune haemolytic anaemia
D111000 Mechanical haemolytic anaemia
D111100 "Microangiopathic haemolytic anaemia";
D111200 Toxic haemolytic anaemia
D111y00 Other specified non-autoimmune haemolytic anaemia
D111z00 Non-autoimmune haemolytic anaemia NOS

4.3.3. Variables for exclusion of patients

4.3.3.1. HIV

In IMS® Disease Analyzer Germany HIV will be identified using ICD 10 codes B20-B24. In IMRD-UK HIV will be identified using codes Read codes starting "A788...", "A789..." or by Read codes "43C3.11", "Eu02400" or "L179.00".

4.3.3.2. Disseminated intravascular coagulation (DIC)

In IMS® Disease Analyzer Germany DIC will be identified using the ICD 10 code D65. In IMRD-UK DIC will be identified using Read code D306.12 "Disseminated intravascular coagulation".

4.3.3.3. Haemolytic-uremic syndrome (HUS)

In IMS® Disease Analyzer Germany DIC will be identified using the ICD 10 code D59.3. In IMRD-UK HUS will be identified using Read code D111300 "Haemolytic-uraemic syndrome"

4.4. Data sources

4.4.1. IMS® Disease Analyzer Germany

IMS® Disease Analyzer Germany (IMS Germany) version December 2020 will be used for the analysis. IMS Germany collects computerised information from specialised and general primary care practices throughout Germany since 1992. Around 3% of GP practices are included in IMS Germany from the different regions in Germany. Data from IMS Germany have been shown to be reasonably representative of German healthcare statistics for demographics and certain diseases [1, 2]. This study will include all practices prescribing the antibiotics of interest and will not be restricted to GP practices only.

Diagnoses are coded using WHO ICD 10 codes, and prescriptions are coded using EphMRA ATC codes and substance names.

4.4.2. IMRD-UK

IMRD-UK contains longitudinal electronic patient records extracted from the VISION practice management software, which has been contributed to by > 790 general practices across the United Kingdom covering up to 6% of the UK population. Data are largely representative of the UK population in terms of age, sex, deprivation status, and geographic distribution. It contains GP prescriptions with medicinal products identified through a bespoke system of drug codes linked to generic drug names (substance names) or a substitute thereof in a drug and device dictionary. Records are available from 1986 onwards.

GPs play a gatekeeper role in the healthcare system in the UK, as they are responsible for delivering primary health care and specialist referrals. Over 98% of the UK-resident population is registered with a GP, so that GP patient records are broadly representative of the UK population in general. Patients are affiliated to a practice, which centralizes the medical information from GPs, specialist referrals, hospitalizations, and tests.

4.5. Study size

The study will not be limited in size. All patients that fulfil the criteria for inclusion will be studied.

4.6. Data management

All analyses will be carried out using SAS Enterprise Guide version 7.15.

4.7. Data analysis

The incidence rate of TTP will be calculated from the number of patients with TTP during the follow-up period and the total follow-up time in years of follow-up in each of the two treatment groups. The 95% confidence intervals for the incidence rates will also be calculated.

Incidence rate = number of patients with TTP ÷ person-time of follow-up in years

In addition, the treatment groups will be compared in terms of age and gender structure (percentage of males/females, percentage of patients by 10-year age groups, mean age, median age). If there are sufficient numbers of events, we will also compare the age and gender structure between patients with and patients without TTP.

For IMRD-UK the study period will be limited to the years 2000 onwards as the TTP diagnosis was seldom used before that date.

For both IMS® Disease Analyzer Germany and IMRD-UK, patients with a history of conditions known to be associated with TTP will be excluded. These will be HIV, Disseminated Intravascular Coagulation (DIC) and Haemolytic Uremic Syndrome (HUS).

It is likely that there will be low numbers of events in the relatively short time windows following exposure: if this occurs, consideration will be given to pooling data from the German and UK data sources to avoid displaying any low cell counts.

4.8. Quality control

The quality of IMS® Disease Analyzer data is ensured by a series of continuous QA controls and data refinement. These include checking incoming data for criteria such as completeness and correctness, (e.g. linkage between diagnoses and prescriptions), and standardizing certain data values such as laboratory test results in order to enable reliable analysis. IMRD-UK contain a number of flags indicating potential data issues in the patient, practice, prescribing and clinical (diagnosis) datasets. The analysis will be restricted to data that are “acceptable” and practices will only be included once they reach the Acceptable Mortality Reporting (AMR) date.

4.9. Limitations of the research methods

4.9.1. IMS® Disease Analyzer Germany

In Germany the patient has free physician choice: in IMS Germany patients can only be followed for as long as they continue to visit the same physician as patients are not identifiable across physician practices for confidentiality reasons. Furthermore, as the patient can visit several physicians concurrently, collected data may be incomplete. Moreover, the completeness of data on outcomes may depend on the extent to which outcomes are captured in primary care vs. secondary care and TTP is a diagnosis likely to be made in secondary care.

4.9.2. IMRD-UK

IMRD-UK holds primary-care electronic healthcare records. TTP is a diagnosis that will very likely be made – at least in part – in secondary care. As such, the completeness of recording of this diagnosis will be dependent on primary care records being updated to reflect secondary care diagnoses. Although this would be expected for what is a serious condition, we are not aware that the diagnosis off TTP has been validated in IMRD-UK or other primary care databases in the UK.

5. Protection of human subjects

IMS® Disease Analyzer Germany is a deanonymized database with electronic health records. No ethics committee approval is required. For IMRD-UK a study protocol must be approved by the Scientific Review Committee (SRC) and the final report approved by IQVIA before the results can be put in the public domain. In doing this, consideration is given to both the scientific validity of the proposal and data privacy with low cell counts (1-5) being suppressed to prevent identification of individuals.

6. Plans for disseminating and communicating study results

Results of the study will be published in the EU-PAS register.

8.4. Annex 4

List of identified systemic broad-spectrum penicillin products in IMRD-UK - To be completed shortly

9. Comments received on draft analysis plan

9.1. PRAC Member: Norway

In general we agree on the draft analysis plan. We support the study design.

We have no knowledge about the databases to be used in the study, the IMS Disease Analyzer

Germany and the IMRD-UK. However, we notice the limitations described, and agree that

it is a limitation of the research method that the diagnosis of TTP is likely to be made in secondary care and may not be completely captured in primary care databases.

As regards outcome variables, only the ICD 10 code M31.1 (Thrombotic microangiopathy) is proposed to be used for the German database. We propose that the same diagnosis codes used for the UK database should also be applied to the German database:

The following codes are available in ICD-10 and should be included as outcome variables for the German database:

- D59.4 Microangiopathic hemolytic anemia
- M31.1 Moschowitz' disease
- M31.1 Thrombotic thrombocytopenic purpura

We suggest that patients with HIV should be excluded as HIV can lead to TTP. In addition, efforts should be taken to exclude cases of DIC and HUS as these syndromes can overlap with TTP.

EMA Response: Regarding microangiopathic hemolytic anaemia, we have now included a sensitivity analysis where also the ICD 10 code D59.4 (other nonautoimmune haemolytic anaemias) is included.

The proposed analysis could be considered as an analysis of narrow (codes that only include the condition of interest) and broad (including also overlapping codes that are not specific for the condition of interest) event definitions. Similarly, the analysis in IMRD-UK has been split into an analysis of narrow and broad TTP events.

We have also as you suggest excluded patients with HIV, DIC and HUS.

9.2. Country: Germany

We agree with the proposed Analysis plan and have some additional comments:

- *It is our understanding that the study refers only to incident users and that a patient is observed only once during the study period. The EMA is asked to briefly clarify if this is correctly understood or if the observation of multiple treatment periods is possible.*
- *If a patient is only observed once within the proposed study period, the EMA is asked to also provide information on incidence proportions.*
- *In some epidemiological studies focusing on FQs, azithromycin has often been used as a comparator. We wonder whether azythromycin could also be included in this data analysis, if feasible.*
- *In general we support the proposed study design. However, we would like to know, also in view of future analyses, whether the case-control design is generally suitable for the conduct of these rapid analyses. This is only because we would have expected a case-control design due to the rarity of the observed events.*

EMA Response: Regarding the first bullet point, it is correctly understood that a patient is observed only once during the study period.

Regarding the second bullet point, we could provide the proportion of cases with TTP as proportion of patients initiating treatment. Please let us know if this is not what you request, and you want instead

to know the number of patients who are excluded from the analysis because they are "prevalent" exposures.

Regarding the third bullet point, a comparison with azithromycin will also be provided.

Regarding the fourth bullet point, we don't think the case-control approach has any advantage over the cohort design in most of the analyses we currently do. Our starting point is to assess the extent of drug exposure on the databases. From there we then assess whether the event of interest occurs in the exposed subjects. This is a logical order. As the potential harms of medicines are typically described as rates (for example in SmPCs as events per 100, 1000, 10000, etc.) an understanding of the extent of exposure is required and this naturally follows from having defined and then followed an exposed cohort. It should be noted that recent commentators have questioned the validity of the case control approach (see *Statistics in Medicine* 2019;38:4199–4208).
