Version 0.1

This project has received funding from the Innovative Medicines Initiative 2 Joint Undertaking (JU) under grant agreement No 806968.

The JU receives support from the European Union's Horizon 2020 research and innovation programme and EFPIA.

Introduction

This document describes how the EMHA (i.e., the institutions Centro Hospitalar do Baixo Vouga, Centro Hospitalar do Baixo Mondego, Centro Hospitalar Vila Nova de Gaia/Espinho) data sources are converted to the OMOP Common Data Model (CDM) version 5.4. This is a collaborative effort by the European Health Data and Evidence Network (EHDEN) project and EMHA. It describes the definition of the ETL that will be used in the implementation.

The document was prepared through team meetings with data experts, healthcare professionals, and IT personnel from EMHA and MTG (the hired SME). This document may be revised throughout the implementation of the project.

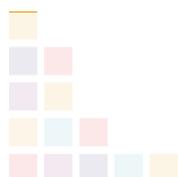

1 Technical Infrastructure

EMHA is kept physically in each hospital's datacenters, which are located within each hospital's own premises. Virtual Machines (Ubuntu 2020 LTS) were set up on each premises in order to install the EHDEN ecosystem tools. The VM has all the tools installed and will be able to connect to the database where the data is stored in order to develop, run and update the ETL and operate the standard EHDEN and OHDSI tools.

A scan report and high level source data diagrams were generated by EMHA using SQL tools available within each hospital. During a few virtual meetings the overall structure of the data was presented to MTG and was translated from Portuguese to English. We decided to implement the data transforms in Python SQLAlchemy. Then these python programs will be compiled into the target SQL and generate the actual queries that will be used by the ETL.

In addition, dynamic mappings for the ETL were developed so that the SQL scripts may be adapted through configuration only, minimizing the need of ETL updates.

2 Data Mapping

Overview

The mapping was carried out straight from database schemas generated by the EMHA team and so there was no need to use Rabbit-in-a-hat, and as such, no diagrams are presented in this document. This decision was because the parties involved were experts in the source data schemas and so manual specification during meetings in the document was faster to accommodate than using the tools. Furthermore most of the document was reverse engineered from SQL queries over the source data to validate the data source, and as such this design document represents a consistent and validated representation of the Decisions regarding specific value mappings will be updated in future versions of this document during the implementation phase.

Overall ETL Structure

This is an ETL that is derived directly from database tables from EHR systems and related softwares. We considered taking an approach where tables are mapped directly from the raw source representations (either raw tables or flattened views over proprietary schemas). The important aspect of this is that no relevant logic for the ETL will be implemented outside the transforms indicated here.

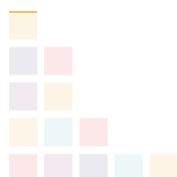

General Cleaning Rules

The source data resides completely in normalized database schemas, and as such, no prior data cleaning is needed. Data will be directly consumed as is and mapped accordingly.

Vocabulary Mapping Structure

We will employ an observable-by-default approach to the mapping. This implies that the actual mappings, even those that may be automatically implemented in the ETL will be hoisted into the SOURCE_TO_CONCEPT table. This table will be auto generated from a set of standardizer Excel Sheets that we will develop specifically to control the mapping.

These documents will not only determine the source mappings, but will also determine the target tables a given concept will go into according to the domain selected. The mapping sheets will be initially auto populated from full text queries against the CONCEPT and

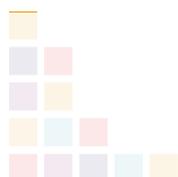

CONCEPT_SYNONYM tables, subject to all relevant DOMAIN and VOCABULARY constraints.

All mappings that are performed via CONCEPT_CODE will not be actively reviewed. All mappings derived from CONCEPT_DESCRIPTION or text based search in synonyms will be subject to manual revision during a second step.

This way there will be complete control of all aspects of vocabulary and structure that are directly dependent on concepts without the need to change implementation of the ETL.

drug_era	Generated from standard query
dose_era	Generated from standard query
condition_era	Generated from standard query
episode	Generated from standard query
episode_event	Generated from standard query
cohort	Generated from ATLAS
cohort_definition	Generated from ATLAS

3 Vocabulary mapping

Data in the EMHA is encoded almost all relevant concepts into standard terminologies, namely ATC Codes for Drugs and ICD-10 for conditions. Vocabularies will be mapped semi automatically as described in section [Vocabulary Mapping Structure](#). Prior to starting manual mapping, all relevant elements will be translated into English using [DeepL](#) translation service.

As described before, we will employ standardized tools based on excel to develop this process. The semi-automatic mapping will be performed using full-text queries against the Vocabulary Tables, and the manual validation and updates will be done using Athena.

Manual mapping is expected to occur for ad-hoc vocabularies as shown below:

Table	Column	Vocabulary
ide_identificacao	sexo	Ad-hoc

4 Next Steps

Once EHDEN approves this report on milestone 1, we would continue with the work as described and implement work steps 4 to 7 for milestone 2. We anticipate milestone 2 to be completed within schedule.
