## 4. Abstract

### Title

Metformin use in renal impairment; Version 2; Main author: Christian Fynbo Christiansen

**Rationale and background:** Metformin is a first-line treatment for most patients with type 2 diabetes mellitus, but contraindicated in patients with certain acute and chronic conditions – including chronic renal dysfunction – because of the feared risk of lactic acidosis. While different guidelines agree on the recommendation to discontinue use of metformin in patients with a glomerular filtration rate (GFR) below 30 ml/min, guidelines differ on the renal impairment threshold that should trigger cautious use and potential dose reduction, with recommended GFR thresholds varying between 60 or 45 ml/min. Use and safety of metformin in patients with renal impairment differs worldwide.

**Research question and objectives:** The three objectives of this project are: 1) to conduct a systematic review of literature relevant to metformin use and renal impairment, 2) to conduct a series of epidemiologic analyses among pharmacologically treated type 2 diabetes patients to examine prevalence of renal impairment in metformin users, use of metformin according to stage of renal impairment, and safety with regard to change in renal function, discontinuation/switching of antidiabetic treatment, and lactic acidosis, 3) to disseminate the study findings.

**Study design:** The project includes a systematic review, and uses data from routine health databases to conduct cross-sectional analyses of drug utilization, and cohort analyses of safety outcomes.

**Population:** The study population will be patients with medically treated type 2 diabetes from Denmark and the United Kingdom. The combined source population comprises 6.9 million persons.

**Variables:** Use of metformin and other hypoglycaemic drugs will be identified by issued (the UK) and filled (Denmark) prescriptions. Renal function will be assessed and staged by the estimated glomerular filtration rate (eGFR) computed from creatinine measurements, age, and sex. Lactic acidosis will be captured by relevant diagnostic codes. Covariates, including comorbidity, comedication, and labs will also be obtained from the databases under study.

**Data sources:** The Danish health and administrative registries covering the population of the North and the Central Denmark Regions and the Clinical Practice Research Datalink (CPRD) covering ~6% of the UK population.

**Study size:** We expect to include 250,000 metformin users from the two countries.

**Data analysis:** The drug utilization analysis will describe characteristics of new and prevalent metformin users and non-users with regard to renal function, demographics, comorbidity, and comedication. Similarly, the characteristics will be described according to level of renal impairment. Incidence rate of lactic acidosis will be estimated for metformin users and non-users, and compared using Cox regression when number of events is sufficient.

**Milestones:** The systematic review was completed on 31 October 2013. The interim report on study results will be submitted to EMA by 31 March 2014. The final report is scheduled to be submitted by 31 May 2014, and a manuscript is expected to be submitted by 31 July 2014.

## 7. Rationale and background

Metformin is a widely used oral glucose-lowering drug for treatment of type 2 diabetes mellitus, approved in European countries in the 1950s.<sup>1;2</sup> While metformin is a first-line treatment for most patients with type 2 diabetes mellitus, it is contraindicated in patients with certain acute and chronic conditions – such as severe infections, cardiac or respiratory failure, shock, and in chronic renal or hepatic dysfunction – because of the feared risk of lactic acidosis.<sup>3</sup> Lactic acidosis is, however, rare and there is no clear-cut evidence that it is more frequent in metformin users compared with patients treated with other glucose-lowering drugs.<sup>4;5</sup>

Metformin is eliminated through renal excretion.<sup>6</sup> Patients with renal impairment may therefore be prone to its side effects. Consequently, guidelines recommend cautious use of metformin in patients with renal impairment, and severe renal impairment is a contraindication for metformin use.<sup>3</sup> While different guidelines agree on the recommendation to discontinue use of metformin in patients with a glomerular filtration rate (GFR) below 30 ml/min, guidelines differ on the renal impairment threshold that should trigger cautious use and potential dose reduction, with recommended GFR thresholds varying between 60 or 45 ml/min.<sup>2;3;7-9</sup> Nevertheless, it has been shown that one-fourth of metformin users have potential contraindications for the drug, including renal impairment, and that one-fourth of patients with renal impairment continued metformin despite reduced renal function.<sup>10</sup> With the conflicting recommendations and utilization patterns, it is important to describe the use and safety of metformin in patients with renal impairment.

This study was commissioned by The European Medicines Agency (EMA or 'the Agency') with the aim to assess the use and safety of metformin in patients with and without renal insufficiency in current clinical practice in at least two EU Member States. This assessment is intended to add evidence to help reassess and unify the guidelines for use of metformin in patients with renal insufficiency.

## 8. Research question and objectives

The three objectives listed below address the use and safety of metformin in patients with renal impairment. Objective 1 is a review of the literature with the aim to address worldwide utilization patterns of metformin with renal impairment. For objective 2, we will characterise the use (extent and dosing) of metformin in renal-impaired patients in Denmark and UK taking account of EU prescribing guidance. This will include examining the severity of impairment while taking into account concomitant medications and co-morbidities, in particular those that might reduce renal excretion of metformin. In addition, the associated risk of lactic acidosis will be quantified. Finally, objective 3 will ensure dissemination of the results from this study.

The specific objectives are:

- **Objective 1:** To conduct a systematic review of literature relevant to metformin use and renal impairment

- **Objective 2:** To conduct a series of epidemiologic analyses among pharmacologically treated type 2 diabetes patients to examine:
  - a. Prevalence of renal impairment and other characteristics among new and prevalent users of metformin (via a cross-sectional drug utilization study design).
  - b. Use of metformin in patients with type 2 diabetes according to stage of renal function impairment (via a cross-sectional drug utilization study design).
  - c. Safety of metformin with regard to development or progression of renal impairment, and discontinuation/switching of antidiabetic treatment; and with respect to lactic acidosis (using cohort study design).
- **Objective 3:** To disseminate the study findings to potentially aid the Agency by providing evidence to review current regulatory guidelines of metformin use among patients with renal impairment

## 9. Research methods

### 9.1. Study design

We will conduct a cross-sectional descriptive drug utilization study of metformin use and a cohort study with follow-up to assess risks for predefined outcomes progression of renal disease and lactic acidosis in metformin users compared with an appropriate comparator of non-users. Given the update status of the two databases, the study population identification period will be 2000 through 2010 (Denmark)/and 2000 through 2011 (the UK) in order to allow at least one year of prescription data before study start and at least one year of follow-up for all included patients. The follow-up will be through 31.12.2011 in Denmark and through 31.6.2012 in the UK.

### 9.2. Setting

The source population for the study will be male and female residents of Denmark and United Kingdom (UK) – the two EU member states covered by relevant medical databases (see section 9.4). The study population will consist of patients with medically treated type 2 diabetes, defined as persons with at least one prescription for an antidiabetic medication aged 30 years or older at time of first recorded prescription. The study population was restricted to patients aged 30 years or older to exclude people with polycystic ovary syndrome and type 1 diabetes, which both are frequently diagnosed under age 30. Only patients with at least one year of prescription history before the index date (study entry or start of follow-up) will be included in order to have an observable washout period for identification of new users. In addition, we will require patients to have at least one measurement of creatinine before study inclusion in order to assess baseline renal function. In Denmark, the study population will be restricted to residents of the North and the Central Denmark regions covered by the Aarhus University Research Database, which includes information on filled prescriptions and laboratory data.<sup>11;12</sup> In the United Kingdom, the study population will be restricted to patients treated by

general practitioners participating in the Clinical Practice Research Datalink (CPRD),<sup>13;14</sup> and who meet the study criteria.

### **9.3. Variables**

#### **Use of metformin and other antidiabetic agents**

Users of metformin will be identified from routine databases that record general-practitioner (GP)-issued prescriptions for metformin (the UK) or dispensed outpatient prescriptions for metformin (Denmark, DK). We will identify all patients who filled at least one prescription for metformin during the study population identification period. New users of metformin will be defined as patients without any prescription for metformin within 365 days before the first metformin prescription ('washout period'=365 days). Otherwise users of metformin will be considered prevalent users. Metformin users will be further stratified by metformin monotherapy and metformin combination therapy including both patients using fixed metformin combinations and patients who are prescribed concurrent hypoglycaemic drugs. Non-users of metformin will include all patients who receive a non-metformin hypoglycaemic drug (including sulfonylurea, insulin, glitazones, and other antidiabetics), but who did not have a prescription for metformin during the study population identification period.

The index date (start of the follow-up) will be the date of first prescription in new users of an antidiabetic drug during the study period; for the prevalent users, the index date will be the 1 January 2000. In Denmark for each patient with at least two prescriptions for metformin, we will estimate the initial daily dose of metformin on the index date. Mean daily dose for the initial prescription will be calculated by dividing the total amount dispensed on the index date by the number of days before the second metformin prescription. Total amount dispensed will be calculated by multiplying the tablet strength by the number of tablets dispensed. For all prescriptions during the study period, we will estimate the mean daily metformin dose using the cumulative dose in all prescriptions divided by the number of days of use. In the CPRD we will estimate initial daily dose from the pill strength multiplied by the number taken each day.

#### **Renal function and renal impairment**

For each patient, we will identify all recorded serum creatinine laboratory values. The creatinine values will be used to assess renal function by calculating estimated glomerular filtration rates (eGFR)<sup>15</sup> at baseline and during follow-up. We will use the 4-variable MDRD equation, which provides estimates of eGFR based on serum creatinine, age, race and sex.<sup>15;16</sup>

The MDRD equation for estimating eGFR is:

$$\text{eGFR} = 186 \times S_{\text{cr}}^{-1.154} \times \text{age}^{-0.203} \times 1.212 \text{ [if black]} \times 0.742 \text{ [if female]}^{16}$$

Since neither of the databases under study contains data on race, the eGFR calculation will assume Caucasian race for all persons in the study. Since the vast majority of Danish and UK citizens are Caucasian this should not present material distortion in the results. Based on eGFR, kidney function will be classified as follows (corresponding to the criteria for chronic kidney disease):

1. Stage 1 and 2 chronic kidney disease (eGFR  $\geq$  60 ml/min/1.73m<sup>2</sup>)
2. Stage 3a chronic kidney disease (eGFR 45-59 ml/min/1.73m<sup>2</sup>)
3. Stage 3b chronic kidney disease (eGFR 30-44 ml/min/1.73m<sup>2</sup>)
4. Stage 4 chronic kidney disease (eGFR 15-29 ml/min/1.73m<sup>2</sup>)
5. Stage 5 chronic kidney disease (eGFR <15 ml/min/1.73m<sup>2</sup>)

### **Lactic acidosis**

We will identify patients who have a recorded inpatient or outpatient diagnosis of lactic acidosis in the Danish National Registry of Patients or in the CPRD. To assess the validity of diagnostic codes, if sufficient number of laboratory measurements is available, we will conduct a validation of the diagnosis using lactate measurements in the laboratory databases. For this validation we will include two definitions of lactic acidosis by using all available lab measurements during the admission: 1) lactate  $\geq$  5 mmol/l and pH  $\leq$  7.35<sup>5;17</sup>, or 2) lactate  $\geq$  2 mmol/l.

### **Covariates**

We will identify the following additional variables from the available data sources to be used as covariates/descriptive characteristics in the analyses. All variables will be measured as of the index date, with appropriate look-back periods as follows:

1. Age at the index date
2. Sex
3. Glycated haemoglobin A1c (HbA1c) level closest measurement within a clinically meaningful period before the index date
4. Time since first recorded antidiabetic drug prescription until the study entry date as a proxy for diabetes duration (categorized as < 1 year; 1-<3 years; 3+ years)
5. Five-year history of potential contraindications for metformin, including recorded diagnoses of: diabetic ketoacidosis, liver disease, severe infections, shock, respiratory failure, and alcohol-related diseases
6. Other chronic diseases, including each of the conditions in the Charlson Comorbidity Index, except for diabetes and diabetes with organ complications<sup>18;19</sup>
7. Concomitant medication including: other antidiabetic medications, NSAIDs, and antihypertensives, antiretroviral medications, aspirin (acetylsalicylic acid)

## **9.4. Data sources**

### **Danish health and administrative registries**

The source population is residents of the North and the Central Denmark regions, with a combined population of about 1.8 million persons or 1/3 of the total Danish population. Data on users of metformin and other antidiabetic drugs are linkable on the individual level from the data sources described below to analyse utilization patterns and disease stability.

The Aarhus University Prescription Database<sup>11</sup> records all reimbursed prescriptions dispensed in community (outpatient) pharmacies of the northern Denmark. Nearly all prescriptions for antidiabetic medications are eligible for general reimbursement and are therefore recorded in this database; more than 98% of antidiabetic medications are sold in the primary sector, and are therefore expected to be recorded in this database. Currently the available data cover the period up to 2011.

The Laboratory Information Systems for North and Central Denmark Regions (LABKA)<sup>12</sup> tracks all hospital-performed laboratory tests, including those sent to hospital laboratories by general practice. Available data include the test name and IUPAC-code, the result, the measurement unit, the dates of ordering and carrying each test. The current inclusive coverage periods are October 1999 to December 2011 for the Central Region, and from 1997 to 2011 for the North Region.

The Danish Central Personal Registry<sup>20;21</sup> covers the entire Danish population and has registered, since 1968, vital status and migration of Danish residents. The registry supplies a unique identifier used to individually link data from different sources.

The Danish National Registry of Patients<sup>22</sup> covers the entire Danish population and has registered hospitalizations since 1977, including outpatient visits since 1995. Up to 20 discharge diagnoses are recorded for each hospital contact, using the International Classification of Diseases 10th revision (ICD-10) since 1994 and ICD-8 in the earlier period. This registry will be used to measure comorbidities and prevalence of contraindications among users of metformin in northern Denmark. Several published studies of metformin have been published based on data from the Danish registries.<sup>23-26</sup>

### **The Clinical Practice Research Datalink (CPRD)**

The CPRD (formerly known as General Practice Research Database) is an ongoing longitudinal database that collects data from over 500 general practices in the UK since 1987. It covers ~6% of the UK population and the age, gender and race/ethnicity distribution is representative of the UK population. This database will be accessed through the Boston Collaborative Drug Surveillance Program (BCDSP). The BCDSP has received the anonymised raw data generated by the GPs since the CPRD was first established. Validation showed that more than 90% of information from the manual medical records present in the GP's office and the indication for more than 95% of newly prescribed drugs was present in the computer file, and also that medical diagnoses from consultant physicians were recorded with high reliability.<sup>13</sup> The CPRD data housed at the BCDSP are updated annually, so that the most recent data will never be

more than 15 months out-of date. The data are recorded using multiple data screens or files. These include the registration, drug, laboratory data, and event files, and files containing additional clinical details. Several published studies of metformin have been published based on data from the CPRD.<sup>4;27-33</sup>

### **9.5. Study size**

The study will be conducted using two databases: data linked from medical registries in Northern Denmark and the Clinical Practice Research Datalink (CPRD) in the United Kingdom. The total population size covered by the databases is 6.9 million persons.

DATABASE	COUNTRY	INDIVIDUALS
Data linked from health and administrative registries in northern Denmark	Denmark	1,924,724
Clinical Practice Research Datalink (CPRD)	United Kingdom	5 Million
	TOTAL	6.9 Million

With an estimated diabetes prevalence of at least 5%, we will expect to include 345,000 patients with type 2 diabetes. We expect to include approximately 50,000 metformin users from Denmark. From the UK, we expect to include around 200,000 metformin users. The rate of lactic acidosis is low: around 3.3 cases per 100,000 person-years,<sup>4</sup> so with an assumed median follow-up time of 7.5 years among the 250,000 metformin users, we would expect to find approximately 62 patients with lactic acidosis.

### **9.6. Data management**

Data will be extracted and linked from routine health care databases and kept on secure servers according to the standard operating procedures of the academic institutions with which the two study sites are affiliated (Aarhus University Hospital and Boston University School of Public Health). Within each study site, data quality assurance will be performed by cross tabulation. The data management programmers and statisticians will generate and conduct quality control review of the interim and final tables and listings for study report. Data management and analyses will be done using SAS Statistical Software Version 9 (Cary, NC, USA).

## 9.7. Data analysis

### Drug utilization analysis

First, we will describe characteristics at baseline (index date) of new and prevalent metformin users and non-users, including:

- Prevalence of renal impairment as classified by estimated glomerular filtration rate (eGFR) using the relevant baseline creatinine measurement
- Initial mean daily dose of metformin (for users of metformin only)
- Mean daily dose of metformin over the study period
- Age at index date
- Sex
- Duration of diabetes
- Mean HbA1c measured in a clinically meaningful period (within 6 or 12 months before the index date).
- History of potential contraindications for metformin (recorded diagnoses of diabetic ketoacidosis, liver disease, severe infections, shock, respiratory failure, and alcohol-related diseases)
- Charlson Comorbidity index score (score of 0, 1, 2, 3, 4+)
- Prevalence of each of the comorbid conditions in the Charlson Comorbidity Index<sup>18;19</sup> (except diabetes and diabetes with organ complications)
- Concomitant medications within 90 days before index date

Second, we will describe the aforementioned characteristics according to the five levels of severity of renal impairment (based on eGFR level, as defined above) at baseline.

The drug utilization study will be conducted including the entire study period, and separately for each calendar year during the study period to assess potential temporal trends in utilisation of metformin.

### Assessment of lactic acidosis and change in kidney function

#### Lactic acidosis

**Incidence estimation.** For the lactic acidosis outcome, we will report incidence rates for metformin users and the comparator group (users of other hypoglycaemics) with 95% confidence intervals (CI). We will compare the rates by estimating hazard ratios and associated 95% CI, using Cox proportional hazard regression adjusted for potential confounders. We will do the analyses overall and stratified by CKD stage, if the number of events is sufficient ( $\geq 5$  per category). To calculate rates of lactic acidosis we will sum person-time for each member of the study from the day of first prescription for metformin/antidiabetic drug until the first of the following occurs: treatment cessation or

switching, death, diagnosis of lactic acidosis, emigration, or end of follow up on 31 December 2011/2012 (Denmark/UK).

**Case series description.** Lactic acidosis is a rare event; even the published meta-analyses with a large combined number of patients could not leverage sufficient power to meaningfully estimate its occurrence. Despite involvement of two large databases in this study, the number of cases may still be insufficient to estimate adjusted incidence rates and rate ratios of lactic acidosis in metformin users and non-users, especially since this association is likely to be confounded by several important risk factors and control of multiple risk factors may not be possible. To fully describe the lactic acidosis with respect to the underlying risk factors, while taking advantage of the available population-based data, we will identify all the cases of lactic acidosis observed in the treated diabetes patients in our study and provide descriptive statistics with respect to all relevant measured characteristics, including use of metformin and other hypoglycaemic agents; comorbidity (including liver disease, alcohol-related disease, and malignancy); renal impairment; co-medication (including anti-retrovirals and aspirin); current acute conditions (shock, severe infection, respiratory failure) and demographics, and provide brief case summaries for each.

### **Change in kidney function**

For each patient in the study we will determine baseline renal function from lab values present in the data files within a clinically relevant (6 months or 1 year) period prior to the first metformin or other hypoglycaemic drug prescription. Each patient will then be followed forward in time and each subsequent measured serum creatinine value will be used to estimate eGFR values and to determine kidney function. We will determine the rate of declining kidney function in users of metformin vs. users of other hypoglycaemics.

We will identify all patients whose eGFRs fall below 60, 45, and 30, and among these we will determine whether users of metformin switch to another hypoglycaemic drug.

- We will examine progression of renal impairment via the following endpoints:
  - Worsening of renal function as reflected by decline in eGFR that results in progressions to a worse stage of CKD compared with the CKD stage at baseline (dichotomous variable)
  - Improvement of renal function as reflected by increase in eGFR that results in progressions to a lower stage of CKD compared with the CKD stage at baseline (dichotomous variable)
  - Need for chronic renal failure therapy (transplantation or dialysis)
  - Dichotomous outcome of progression to stage 4 or 5 CKD, stratified by baseline stage if possible
- Discontinuation/switching of current antidiabetic drug

The proposed approach will allow evaluation of renal function at the start of antidiabetic treatment and its progression in different treatment groups. By comparing progression of renal disease among users of metformin and users of other drugs, an inference can be made about

whether changes in recommendations for metformin use are warranted, taking into account the pre-existing characteristics of each exposure cohort.

Annex 3 lists codes for diagnoses, drugs, and laboratory measurements used to identify study variables.

## **9.8. Quality control**

### **Aarhus University Hospital**

All data management and analyses are performed by trained statistician familiar with the structure and contents of the Danish National Registries. Epidemiologists and statisticians work closely together to ensure correct clinical definitions and data integrity. The project statistician works under close supervision of a senior statistician and can draw on the Department's collective expertise to address project-specific issues. Each report that is sent outside the Department of Clinical Epidemiology must be approved by professor- or associate-professor level senior epidemiologist.

Data on dispensed prescriptions in the AUPD is collected for reimbursement using bar code scans, thus minimizing the probability of error. Data in the LABKA database are of high quality and are used as gold standard to validate information on laboratory data from other sources.

Data on medical diagnoses in the Danish National Registry of Patients generally have acceptable validity and completeness for use in epidemiologic studies. Specifically, the Charlson Comorbidity Index diagnoses in this registry have high quality.

### **Boston Collaborative Drug Surveillance Program**

#### *Identifying a study population*

For each study the researchers define the criteria for inclusion in the study population.

For example, each member of the study population must have at least 1 year of recorded data in the electronic record prior to receipt of the first study drug. After creation of the population by a BCDSB programmer, a researcher will review a random sample of electronic case records ("profiles") to be sure that all criteria have been successfully fulfilled. That is, all members of the population have received a prescription for a study drug, have adequate pre-drug data, etc.

#### *Study outcome identification*

After the study population passes this quality check, study outcomes are then defined and identified from within this population. Depending on the study, study outcome definitions can be straight forward or quite complicated. In all instances, however, a sample of patient profiles is reviewed to validate the study outcome ascertainment process and definition. Were the correct codes used? Were exclusion and inclusion criteria properly applied? Often every

patient profile with study outcomes is reviewed by a researcher to ensure that all cases meet all study criteria.

#### *Creation of the analysis file*

Once the study population has been created and study outcomes have been identified, an analysis file is created. This file is created by the researcher in conjunction with a programmer, where the researcher defines all study variables and covariates and the programmer extracts the data from the data files to create a dataset for use in all data analyses. Each variable is checked against a random sample of patient profiles to be sure that they have been correctly coded. For example, where presence of certain diseases is defined the researcher checks to be sure that they were coded correctly. All exposure variables are checked to ensure proper coding for each study conducted.

#### *Laboratory data validation*

We will identify all serum creatinine and HbA1c values occurred within a clinically relevant period before the index date and any time during follow-up. We will review the units of measurement associated with the lab values listed in the computerized medical records of the study population. Then we will review any records with obvious outliers to validate their values in relevant units and discard any clearly erroneous entries. Finally we will review lab entries (values and units of measurement) for a random sample of 50 subjects in the computerized medical records to confirm that the values are coded correctly and are consistent with relevant units.

#### *Data analysis*

We will be creating cross tabulations of the various exposure-outcome relations and checking them against the results of the regression analyses.

### **9.9. Limitations of the research methods**

The study includes virtually complete population-based data from Denmark and a representative sample of general practices in the UK, thereby minimizing selection bias.

The potential for information bias should, however, be considered. Estimation of eGFR depends on quality of laboratory data. The laboratory data are virtually complete, but estimation of eGFR depends on steady state of serum creatinine, which is difficult to assess using the available data. However, the restriction to outpatient measurement will remove any influence by severe acute illness. A further limitation is that we will restrict the study population to people with both baseline and follow-up creatinine values. The implications of this selection bias will be discussed in the report.

Exact creatinine clearance (CrCl) is rarely measured, and we therefore need to rely on the estimation by one of the widely used equations to calculate eGFR. To consistently conduct analysis in both datasets we will evaluate renal function via eGFR only and discuss potential implications of using eGFR in the report. The Cockcroft-Gault equation requires body weight for

calculation of estimated CrCl and eGFR. Body weight data is not available in Denmark and is not complete in the UK CPRD. Thus, we will have limited information for eGFR if we use the Cockcroft-Gault equation. It is reported that eGFR calculated by the modified MDRD equation is often more accurate and precise than the Cockcroft-Gault equation, and the CKD-EPI equation is equivalent to or even more accurate than the MDRD study equation, especially at higher GFR.<sup>3</sup> In the first protocol we had proposed using the CKD-EPI equation.<sup>34</sup> However, the CKD-EPI equation was developed for use only with standardized creatinine values. Most of our study period in both Denmark and the UK, includes non-standardized creatinine values which would make it more prudent to use the MDRD equation (for non-standardized creatinine values) for estimating eGFR.<sup>16</sup>

We will use issued/filled prescriptions as a proxy for antidiabetic drug use which is assumed to be reasonable as non-adherence is expected to be low for these drugs.

To our knowledge, there is no formal validation of the diagnosis of lactic acidosis. However, the diagnosis is expected to have high positive predictive value while it may have low completeness especially for less severe cases. Any misclassification could be differential as clinicians may be more likely to identify and code lactic acidosis in metformin users, due to the concern of this side effect. We will address accuracy of coding using laboratory data on blood lactate to confirm the diagnosis.

#### **9.10. Other aspects**

Not applicable

### **10. Protection of human subjects**

In Denmark, the study is approved by the Danish Data Protection Agency (jr. numbers: 2006-53-1346 and 2006-53-1396). This observational study does not require ethical committee approval in Denmark because the study does not involve direct contact with patients. In the UK we will obtain ethical approval from the CPRD's Independent Scientific Advisory Committee.

### **11. Management and reporting of adverse events/adverse reactions**

Not applicable

### **12. Plans for disseminating and communicating study results**

The Interim and the Final report on study results, along with the systematic review will be submitted to the Agency. Based on the systematic review and the final report of study results, two standard scientific manuscripts will be prepared for publication in an international peer-reviewed journal.

4.2.6 Seasonality?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	
4.3 Does the protocol define how the study population will be sampled from the source population? (e.g. event or inclusion/exclusion criteria)	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	10

Comments:

<b><u>Section 5: Exposure definition and measurement</u></b>	<b>Yes</b>	<b>No</b>	<b>N/A</b>	<b>Page Number(s)</b>
5.1 Does the protocol describe how exposure is defined and measured? (e.g. operational details for defining and categorising exposure)	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	10,11
5.2 Does the protocol discuss the validity of exposure measurement? (e.g. precision, accuracy, prospective ascertainment, exposure information recorded before the outcome occurred, use of validation sub-study)	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	10,11,12,18
5.3 Is exposure classified according to time windows? (e.g. current user, former user, non-use)	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	10
5.4 Is exposure classified based on biological mechanism of action and taking into account the pharmacokinetics and pharmacodynamics of the drug?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	14
5.5 Does the protocol specify whether a dose-dependent or duration-dependent response is measured?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	14

Comments:

<b><u>Section 6: Endpoint definition and measurement</u></b>	<b>Yes</b>	<b>No</b>	<b>N/A</b>	<b>Page Number(s)</b>
6.1 Does the protocol describe how the endpoints are defined and measured?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	10,11
6.2 Does the protocol discuss the validity of endpoint measurement? (e.g. precision, accuracy, sensitivity, specificity, positive predictive value, prospective or retrospective ascertainment, use of validation sub-study)	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	11,18

Comments:

<b><u>Section 7: Confounders and effect modifiers</u></b>	<b>Yes</b>	<b>No</b>	<b>N/A</b>	<b>Page Number(s)</b>
7.1 Does the protocol address known confounders? (e.g. collection of data on known confounders, methods of controlling for known confounders)	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	12
7.2 Does the protocol address known effect modifiers? (e.g. collection of data on known effect modifiers, anticipated direction of effect)	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	12

Comments:

<b><u>Section 8: Data sources</u></b>	<b>Yes</b>	<b>No</b>	<b>N/A</b>	<b>Page Number(s)</b>
8.1 Does the protocol describe the data source(s) used in the study for the ascertainment of:				
8.1.1 Exposure? (e.g. pharmacy dispensing, general practice prescribing, claims data, self-report, face-to-face interview, etc.)	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	12
8.1.2 Endpoints? (e.g. clinical records, laboratory markers or values, claims data, self-report, patient interview including scales and questionnaires, vital statistics, etc.)	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	12
8.1.3 Covariates?				

<b>Section 8: Data sources</b>	<b>Yes</b>	<b>No</b>	<b>N/A</b>	<b>Page Number(s)</b>
	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	12
8.2 Does the protocol describe the information available from the data source(s) on:				
8.2.1 Exposure? (e.g. date of dispensing, drug quantity, dose, number of days of supply prescription, daily dosage, prescriber)				
8.2.2 Endpoints? (e.g. date of occurrence, multiple event, severity measures related to event)	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	12
8.2.3 Covariates? (e.g. age, sex, clinical and drug use history, co-morbidity, co-medications, life style, etc.)	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	12
	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	12
8.3 Is a coding system described for:				
8.3.1 Diseases? (e.g. International Classification of Diseases (ICD)-10)	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	12
8.3.2 Endpoints? (e.g. Medical Dictionary for Regulatory Activities (MedDRA) for adverse events)	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	12
8.3.3 Exposure? (e.g. WHO Drug Dictionary, Anatomical Therapeutic Chemical (ATC) Classification System)	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	12
8.4 Is the linkage method between data sources described? (e.g. based on a unique identifier or other)	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	12

Comments:

<b>Section 9: Study size and power</b>	<b>Yes</b>	<b>No</b>	<b>N/A</b>	<b>Page Number(s)</b>
9.1 Is sample size and/or statistical power calculated?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	13

Comments:

We estimated the number of observations available for analyses in the two databases

<b>Section 10: Analysis plan</b>	<b>Yes</b>	<b>No</b>	<b>N/A</b>	<b>Page Number(s)</b>
10.1 Does the plan include measurement of excess risks?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	
10.2 Is the choice of statistical techniques described?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	14
10.3 Are descriptive analyses included?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	14
10.4 Are stratified analyses included?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	14
10.5 Does the plan describe methods for adjusting for confounding?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	14
10.6 Does the plan describe methods addressing effect modification?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>

<b><u>Section 12: Limitations</u></b>	<b>Yes</b>	<b>No</b>	<b>N/A</b>	<b>Page Number(s)</b>
12.1 Does the protocol discuss:				
12.1.1 Selection biases?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	18
12.1.2 Information biases?  (e.g. anticipated direction and magnitude of such biases, validation sub-study, use of validation and external data, analytical methods)	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	18
12.2 Does the protocol discuss study feasibility? (e.g. sample size, anticipated exposure, duration of follow-up in a cohort study, patient recruitment)	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	13
12.3 Does the protocol address other limitations?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	18

Comments:

<b><u>Section 13: Ethical issues</u></b>	<b>Yes</b>	<b>No</b>	<b>N/A</b>	<b>Page Number(s)</b>
13.1 Have requirements of Ethics Committee/Institutional Review Board approval been described?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	
13.2 Has any outcome of an ethical review procedure been addressed?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	
13.3 Have data protection requirements been described?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	19

Comments:

<b><u>Section 14: Amendments and deviations</u></b>	<b>Yes</b>	<b>No</b>	<b>N/A</b>	<b>Page Number(s)</b>
14.1 Does the protocol include a section to document future amendments and deviations?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	7

Comments:

<b>Section 15: Plans for communication of study results</b>	<b>Yes</b>	<b>No</b>	<b>N/A</b>	<b>Page Number(s)</b>
15.1 Are plans described for communicating study results (e.g. to regulatory authorities)?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	7,19
15.2 Are plans described for disseminating study results externally, including publication?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	19
