PASS information

Title	Post-marketing study of ropinirole prolonged release tablets: Evaluation of the short term drug utilisation patterns and long term use of Ropinirole-PR using the clinical practice research database (CPRD)
Protocol version identifier	1
Date of last version of protocol	29 September 2015
EU PAS register number	Study not registered.
Active substance	Ropinirole
Medicinal product	Trade names Adartrel; Requip; Requip XL; Spiroco XL; Ralnea XL
Product reference	Ropinirole [2mg] Prolonged-release tablet (PL 10592/0293) Ropinirole [3mg] Prolonged-release tablet (10592/0294) Ropinirole [4mg] Prolonged-release tablet (PL 10592/0295) Ropinirole [8mg] Prolonged-release tablet (PL 10592/0296)
Procedure number	MHRA Ref No: PL 10592/0293 – 0001

Marketing authorisation holder(s)	Adartrel: GlaxoWellcome UK Ltd. Requip and Requip XL – SmithKline Beecham Ltd
Joint PASS	No
Research question and objectives	The primary objective of this study is to estimate the risk of dyskinesias amongst individuals prescribed the prolonged release ropinirole as monotherapy, compared to individuals initiating immediate release dopamine agonist monotherapy. Additional outcomes of interest are impulse control disorders, on-off phenomena and time to levodopa initiation. Secondary objectives include evaluating adherence to medication and off label use of medication
Country(-ies) of study	England and Wales.

3. ABSTRACT

Title

Post-marketing study of ropinirole prolonged release tablets: Evaluation of the short term drug utilisation patterns and long term use of Ropinirole-PR using the clinical practice research database (CPRD)

Rationale and background

The proposed study is required as part of a post marketing commitment to the MHRA to evaluate the long term safety of ropinirole-PR. Specifically, it is proposed to estimate the incidence of dyskinesias, on-off phenomena and impulse control disorders, in Parkinson's patients initiating ropinirole-PR monotherapy as compared to those initiating immediate release dopamine agonists as monotherapy up to a maximum of 5 years of treatment. The study will use data recorded on the Clinical Practice Research Datalink (CPRD) a primary care based observational data source, supplemented with data to be obtained by GP questionnaire. As part of these activities, treatment persistence and adherence will be evaluated as well as off-label use of ropinirole-PR.

Research question and Objective(s)

Primary objectives:

1: To estimate, amongst individuals with Parkinson's disease, the incidence rate ratio of dyskinesia in individuals initiating ropinirole-PR monotherapy compared to those initiating immediate release dopamine agonist monotherapy. Incidence rate ratios will also be estimated for other outcomes of interest, notably on-off phenomena and impulse control disorders. The exposure groups will be propensity score matched.

Secondary objectives:

2: To describe and compare the baseline characteristics of individuals initiating ropinirole-PR with those initiating immediate release dopamine agonist monotherapy for PD.

3: To describe treatment persistence and adherence amongst patients initiating therapy on ropinirole-PR versus a matched cohort initiating immediate release dopamine agonists.

4: To describe the extent of off-label use amongst ropinirole-PR initiators.

Study Design

Propensity matched cohort design with adjustments for time varying covariates

Population, including the setting and study population

Parkinson's disease patients initiating an oral dopamine agonist therapy between 2004 and 2012 will be eligible for inclusion in the study. Follow-up will commence at date of initiation of treatment +30days (index date). Individuals with an outcome of interest on or prior to index date will be excluded. Follow-up will continue to the earliest of development of an outcome of interest, treatment discontinuation+30days, end of follow-up, up to a maximum of 5 years of treatment. The treatment exposure groups of interest are PD patients initiating ropinirole-PR monotherapy or immediate release dopamine agonist monotherapy. Propensity score matching will be used to reduce the risk of confounding by indication, and aims to ensure that the exposure groups are similar with regards to baseline characteristics.

Variables

Outcomes: Incident dyskinesia and impulse control disorders will be identified using READ codes and be supplemented with information to be obtained by GP questionnaire. On-off phenomena will be identified based on GP responses alone. Time to levodopa initiation will be estimated to determine whether differences exist between the exposure groups, this will be determined based on prescription patterns on the CPRD

Covariates: Demographics, PD disease duration, PD treatment history and duration, Charlson comorbidity score and morbidity burden at baseline.

Time varying covariates: Initiation of levodopa, COMT inhibitor, MAOB-I, or decarboxylase inhibitor during follow-up

Data sources:

The study will be conducted using the Clinical Practice Research Datalink (CPRD), a primary care database. In the UK ongoing treatment of PD is managed in the primary care setting. This database provides longitudinal follow-up on a representative sample of the U.K. general population.

Study size

A recent feasibility assessment identified 577 individuals initiating ropinirole-PR as monotherapy and 1660 initiating an immediate release dopamine agonist monotherapy on the CPRD. Up to three comparators will be matched to each ropinirole-PR monotherapy patient. The anticipated GP response rate is 68%, which is response rate achieved in the pilot study.

A Cox regression of the log hazard ratio on a covariate with a standard deviation of 0.5000 based on a sample of 1000 observations, based on independent sampling of the exposure groups (i.e. no matching) achieves 82% power at a 0.05 significance level to detect a regression coefficient equal to 0.4055. The sample size was adjusted for an anticipated event rate of 0.2000. It is hoped that in the present study the use of matched samples will give some additional power.

Data analysis

A Cox proportional hazards regression model will be used to evaluate time to dyskinesias in individuals prescribed ropinirole-PR with those prescribed other dopamine agonists of interest. Patients will be followed up from index date (initiation of treatment) up to a censoring event (earliest of the outcome of interest, discontinuation of therapy+30days or end of CPRD follow-up).

Crude and adjusted hazard ratios and 95% CI will be estimated amongst individuals who are free from the outcome of interest at baseline and meeting all inclusion criteria in the two groups of interest (**ropinirole PR cohort** and the **IR-DA matched cohort**) accounting for time varying covariates.

Milestones

ISAC approval will be sought in October 2015. Analysis will commence once approval by ISAC has been granted.

4. AMENDMENTS AND UPDATES

Amendment or update no	Date	Section of study protocol	Amendment or update	Reason

5. MILESTONES

Milestone	**Planned date**
Submission to ISAC for approval	October-November 2015
Registration in the EU PAS register	*Following ISAC approval*
Identification of study populations	November 2015
Start of data collection (GP questionnaire)	January 2016
Interim review of response rate	March 2016
End of data collection	May 2016
Review of achieved response rate	May 2016
Analysis of data	June 2016
Final report of study results	September 2016

6. RATIONALE AND BACKGROUND

6.1. Background

6.1.1. Parkinson's disease

Parkinson's disease (PD) is an age-related progressive neurodegenerative condition, the underlying pathology of PD involves progressive loss of nigrostriatal neurones which

results in deficiency of the neurotransmitter dopamine. The mean age of onset is about 65 years, however an early onset form of the condition exists affecting individuals aged less than 40 years. Similar frequencies are observed in males and females. The overall age-adjusted prevalence is approximately 0.3% overall and 1% of individuals aged >60 years.(Samii et al, 2004)

6.1.2. Treatment of Parkinson's disease

Currently available therapies aim to replace or compensate for the lost dopamine in order to improve motor function. There are no disease modifying therapies available.

Choice of initial therapy depends on a patient's age and specific symptoms. If motor symptoms are mild but require therapy, patients may initiate a monoamine oxidase B inhibitor before moving to more potent dopaminergic therapies such as levodopa or a dopamine agonist.

There is a higher incidence of levodopa-related dyskinesia in younger-onset PD, as such dopamine agonists are usually introduced as initial treatment for patients younger than 60 years. (Connolly & Lang, 2014) With time, individuals controlled initially with dopamine agonist monotherapy will eventually require the addition of levodopa to adequately control their symptoms.

In patients aged >=60 years, the levodopa is often favoured as the first line treatment. (Connolly & Lang, 2014)

6.1.2.1. Dopamine agonists

Two subclasses of dopamine agonist exist: ergot (bromocriptine, pergolide, lisuride, α-dihydroergocriptyne and cabergoline) and non-ergot (apomorphine, rotigotine, piribedil, pramipexole and ropinirole).

Whereas the aim of levodopa treatment is to replace dopamine, dopamine agonists exert their anti-parkinsonian effects by acting directly on dopamine receptors and mimicking the endogenous neurotransmitter. (Brooks, 2000) (Bonuccelli & Ceravolo, 2008)

Dopamine agonists can be used as monotherapy or as an adjunct to levodopa. When used as monotherapy, the intention is to delay the need to initiate levodopa therapy and hence deferring the onset of levodopa associated complications. Since younger age-of-onset of Parkinson disease is a risk factor for motor fluctuations and dyskinesia, dopamine agonists are usually introduced as initial treatment for patients younger than 60 to 65 years. (Brooks, 2000)

Most patients that initiate dopamine agonist therapy will eventually need the addition of levodopa to their treatment regimen. (Connolly & Lang, 2014) Conversely, individuals initiating their treatment as levodopa monotherapy may be prescribed a dopamine agonist as adjunctive therapy in patients exhibiting fluctuating motor responses and dyskinesias associated with its chronic use.(Connolly & Lang, 2014; Giroux, 2007) Addition of dopamine agonists allows a reduction in dose of levodopa and leads to improvement in the disabling complications.

Known side effects of dopamine agonists include hallucinations, excessive daytime sleepiness, hypotension and nausea. (Bonuccelli & Ceravolo, 2008) Ergot derived dopamine agonists are also associated with an increased risk of cardiac valve regurgitation and as a result are not generally prescribed. (Schade et al, 2007) Other potential complications of PD medications include impulse control behaviours. (Bonuccelli & Ceravolo, 2008) (British National Formulary, 2015)

Ropinirole for the treatment of Parkinson's disease (prolonged and immediate release)

Ropinirole is a potent and highly selective non-ergot dopamine receptor agonist that is active both peripherally and centrally. It is indicated for Parkinson's disease and the symptomatic treatment of moderate to severe idiopathic restless legs syndrome (RLS). Ropinirole has been approved and marketed in the UK for the treatment of PD for over fifteen years and has been shown to be well tolerated and effective.(Adler et al., 1997; Pahwa et al, 2004)

Immediate release formulation:

Ropinirole is available as an immediate release (IR) formulation (REQUIP™) and is administered three times daily for the treatment of PD. The initial daily dose is 0.75mg titrating upwards to a maximum dose of 24mg daily.

Prolonged release formulation:

A prolonged release formulation of ropinirole (ropinirole-PR) has been more recently developed for the treatment of PD and has the advantage of being taken only once a day providing a simplified dosing regimen and reduced pill-burden. Ropinirole-PR is available in 2, 3, 4 and 8 mg tablet strengths. The initial dose of treatment is 2mg once daily, to a maximum daily dose of 24mg based on the patient's response. For patients switching from ropinirole-IR, patients should be switched to the equivalent daily dose of ropinirole-PR. Ropinirole-PR was licensed in 2008.

The once daily dosing has the potential to improve compliance, which may lead to improved efficacy. The prolonged release formulation reduces plasma-level fluctuations in the concentration of ropinirole over a 24 hour period, producing a smoother pharmacokinetic profile which may result in a reduced potential to cause side-effects.(Pahwa R et al., 2007)

6.1.2.2. Levodopa

Levodopa is the first line treatment of choice amongst PD patients aged over 60 years. Levodopa is the amino acid precursor of dopamine and remains the most potent and widely used antiparkinson drug throughout much of the disease course. In combination with a peripheral decarboxylase inhibitor, it is the most effective symptomatic treatment. Levodopa enters dopaminergic neurons where it is metabolised to dopamine, replacing the depleted endogenous neurotransmitter.

Known side-effects of levodopa include dyskinesias and on-off fluctuations. (British National Formulary, 2015)

6.1.2.2.1. Levodopa add-on therapies

Decarboxylase inhibitors, Catechol O-methyltransferase (COMT) inhibitors and inhibitors are often prescribed together with levodopa to prolong its action. Monoamine oxidase type B (MAOB) inhibitors prevent the breakdown dopamine in the brain. Whereas decarboxylase and COMT inhibitors are generally only prescribed with levodopa, MAOB-I's can be used on its own in the early stages of the condition or in conjunction with levodopa. In this situation, it reduces the required dosage of levodopa and prolongs its action.

6.1.3. Motor complications associated with long-term treatment of PD

A complication of long-term dopaminergic treatment for PD, are the development of motor fluctuations (such as end-of-dose wearing-off, on-off phenomena) and dyskinesias. (Samii et al., 2004). Motor complications can impair quality of life and cause significant disability for patients. (Connolly & Lang, 2014)

6.1.3.1. End-of-dose wearing off

End-of-dose wearing off develops as the disease progresses and is often one of the first signs of motor complication associated with therapy. (Santens & de Noordhout, 2006)

With continued loss of substantia nigra, the treatment benefit of each dose of levodopa progressively shortens. Patients notice a re-emergence of their Parkinsonian signs within 4 hours or less after administration of a single dose of levodopa. Symptom control can be regained by taking the next levodopa dose.

End of dose wearing off is a relatively predictable variation of motor fluctuations that is temporally associated with the timing of levodopa ingestion. A study of 60 incident PD patients by Thomas et al found that 30% on dopamine agonist mono therapy experienced ''wearing-off'' 15–21 months after beginning treatment. (Thomas et al., 2006)

6.1.3.2. On-off phenomena

"On-off" phenomenon refers to a switch between mobility and immobility in levodopa-treated patients, which occur, as sudden and unpredictable motor fluctuations. Periods of improved mobility are known as "on" periods during which the patient responds to levodopa and where medication is providing symptomatic benefit and periods of impaired motor function or "off" responses in when symptomatic benefit has been lost over the preceding minutes or hours.(Samii et al., 2004)

Strategies for reducing the time that medication is not optimally effective ("off" time) include increasing the dosage of dopaminergic medication, adding another dopaminergic medication, dividing the levodopa dosage into smaller but more frequent doses (levodopa dose fractionation), or adding a COMT inhibitor or MAOB inhibitor to inhibit the breakdown of levodopa and dopamine and prolong their effects. (Pahwa et al., 2006)

6.1.3.3. Dyskinesias

Dyskinesias are drug-induced involuntary movements including chorea and dystonia and describes a group of abnormal involuntary (non-tremor) movements that appear to be a fragmentation of the normal smoothly controlled limb and facial movements. They are a central side effect of dopaminergic therapy and represent a major clinical problem in the management of patients with PD. Dopaminergic reduction strategies will reduce dyskinesias but worsen PD symptoms. Amantadine may be used to reduce dyskinesia severity. (Connolly & Lang, 2014)

Dyskinesias are reported to occur in up to 45% of patients after 5 years of therapy with levodopa and 20% amongst those prescribed a dopamine agonist. (Gomez, et al., 1997; Rascol et al., 2000; Samii et al., 2004)

6.1.4. Impulse control disorders (ICDs)

ICDs are defined as behaviours that are performed repetitively, excessively, and compulsively to an extent that interferes in major areas of life functioning. In recent years, there has been increasing evidence and awareness that PD patients are at increased risk of developing one or more of four major ICDs, which are compulsive or pathological gambling, buying, sexual, and eating behaviours. (Weintraub et al., 2014)

Amongst patients prescribed levodopa, motor complications can occur as early as 2 years into therapy, although it is generally assumed that motor fluctuations occur in about 50 percent of patients after 5 years of levodopa treatment, increasing to 70 percent among patients treated for 15 years or more. (Giroux, 2007) (Santens & de Noordhout, 2006)

Dopamine agonists are less likely than levodopa to cause dopaminergic motor complications, particularly dyskinesia. The reason for this is not known, however it may be related to the longer half life of dopamine agonists and differences in receptor selectivity.(Brooks, 2000) Evidence suggests that the abnormal pulsatile stimulation of dopamine receptors by the intermittent administration of agents with short half-lives such as levodopa is an important factor in the development of motor fluctuations. (Olanow & Obeso, 2000) (Santens, et al., 2003) (Brooks, 2000; Samii et al., 2004)

Initiating therapy with a long-acting dopamine agonist has been shown to delay the onset and reduce the severity of motor complications in MPTP monkeys and PD patients. Administering levodopa with a COMT inhibitor to block its peripheral metabolism increases its plasma half-life and might have a similar effect.(Olanow & Obeso, 2000)

At the time of submission, the MHRA expressed concerns about the long-term consequences of continuous dopamine agonism in PD patients prescribed ropinirole-PR. GSK have therefore proposed to conduct a post-marketing observational study using the Clinical Practice Research Datalink (CPRD) in order to address these concerns. A post-marketing study will be conducted incidence of known consequences of dopamine agonism over a five-year period in Parkinson's patients initiating ropinirole PR as monotherapy compared to those initiating immediate release dopamine agonist monotherapy.

Additional questions that GSK will address include evaluating adherence and persistence to medication off label use of ropinirole PR.

7. RATIONALE

GSK has committed to conducting a post-marketing observational study to evaluate the long-term consequences of continuous dopamine agonism in PD patients initiating ropinirole-PR monotherapy compared to those initiating an immediate release dopamine agonist monotherapy. GSK have proposed to conduct this post-marketing observational study using data from the CPRD, a UK primary care dataset.

8. RESEARCH QUESTION AND OBJECTIVE(S)

The aim of this study is to estimate the incidence of dyskinesias, on-off phenomena and impulse control disorders amongst PD patients initiating prolonged release ropinirole (ropinirole-PR) monotherapy compared to those initiating immediate release dopamine agonist monotherapy using data from the CPRD.

8.1. Primary objectives:

1: To estimate, amongst individuals with Parkinson's disease, the incidence rate ratio of dyskinesia in individuals initiating ropinirole-PR monotherapy compared to those initiating immediate release dopamine agonist monotherapy. Incidence rate ratios will also be estimated for other outcomes of interest, notably on-off phenomena and impulse control disorders. The exposure groups will be propensity score matched.

8.2. Secondary objectives:

2: To describe and compare the baseline characteristics of individuals initiating ropinirole-PR with those initiating immediate release dopamine agonist monotherapy for PD.

3: To estimate time to levodopa use amongst PD patients initiating ropinirole-PR monotherapy and those initiating immediate release dopamine agonist monotherapy.

4: To describe treatment persistence and adherence amongst patients initiating therapy on ropinirole-PR versus a matched cohort initiating immediate release dopamine agonists.

5: To describe the extent of off-label use amongst ropinirole-PR initiators.

9. RESEARCH METHODS

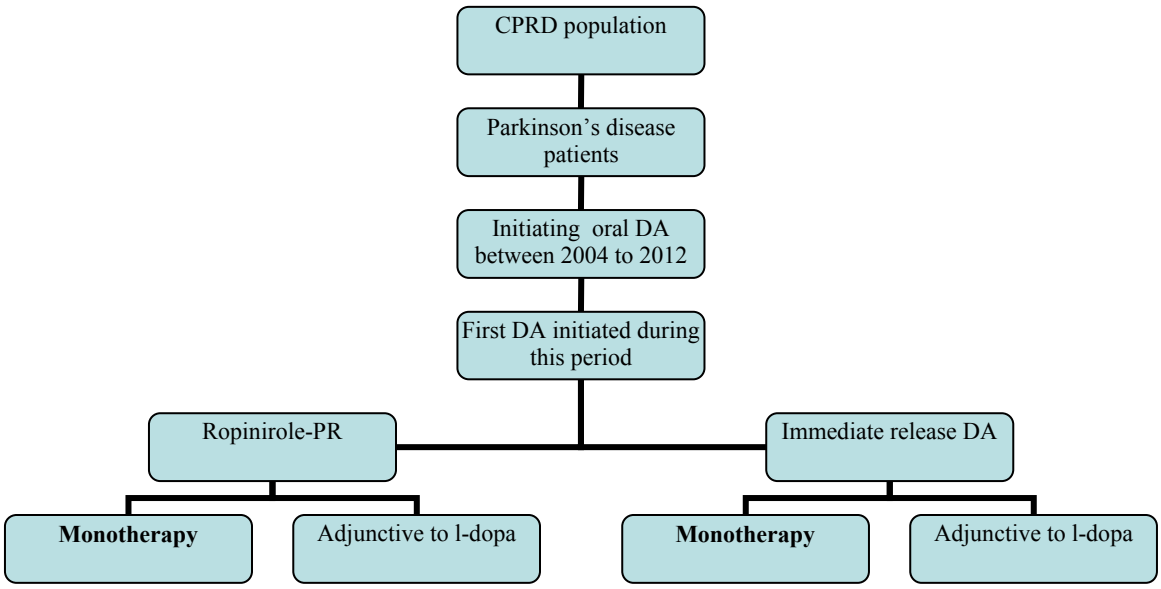
This observational study will involve retrospective analysis of longitudinal electronic medical records (EMR) from the CPRD. This will be supplemented with data to be obtained by GP questionnaire.

9.1. Design

This study will use a propensity matched cohort design with adjustments for time varying covariates. Parkinson's disease patients initiating an oral dopamine agonist therapy between 2004 and 2012 will be eligible for inclusion in the study.

Comparisons will initially be made between individuals initiating ropinirole-PR and those initiating immediate release dopamine agonists for their Parkinson's disease. Patient demographics and medical history up to the time of initiation of therapy will be described and compared between the two groups. Treatment histories will also be evaluated in order to determine whether patients initiated their therapy as an adjunct to levodopa or as dopamine agonist monotherapy. Figure 1 provides an overview of the eligible population.

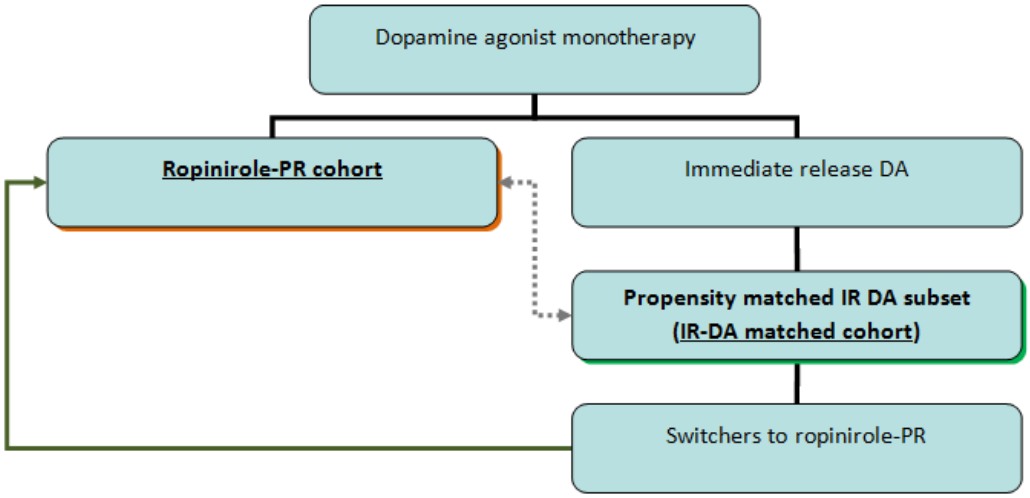
Figure 1 Overview of populations of interest



The longitudinal analysis will be restricted to individuals prescribed their dopamine agonist as a monotherapy (i.e. without concomitant use of or a history of levodopa use). The reason for this is because of the complexity of the PD treatment pathway and because patients already established on levodopa may be prescribed a dopamine agonist as an adjunct to help alleviate existing motor fluctuations associated with levodopa use.

Individuals initiating immediate release dopamine agonists as monotherapy will be propensity score matched to individuals initiating ropinirole-PR monotherapy to ensure comparability between groups and to minimise confounding (**ropinirole-PR cohort**). Individuals initially in the IR-DA cohort that switch to ropinirole-PR will enter the ropinirole-PR cohort at the time of switch. See Figure 2.

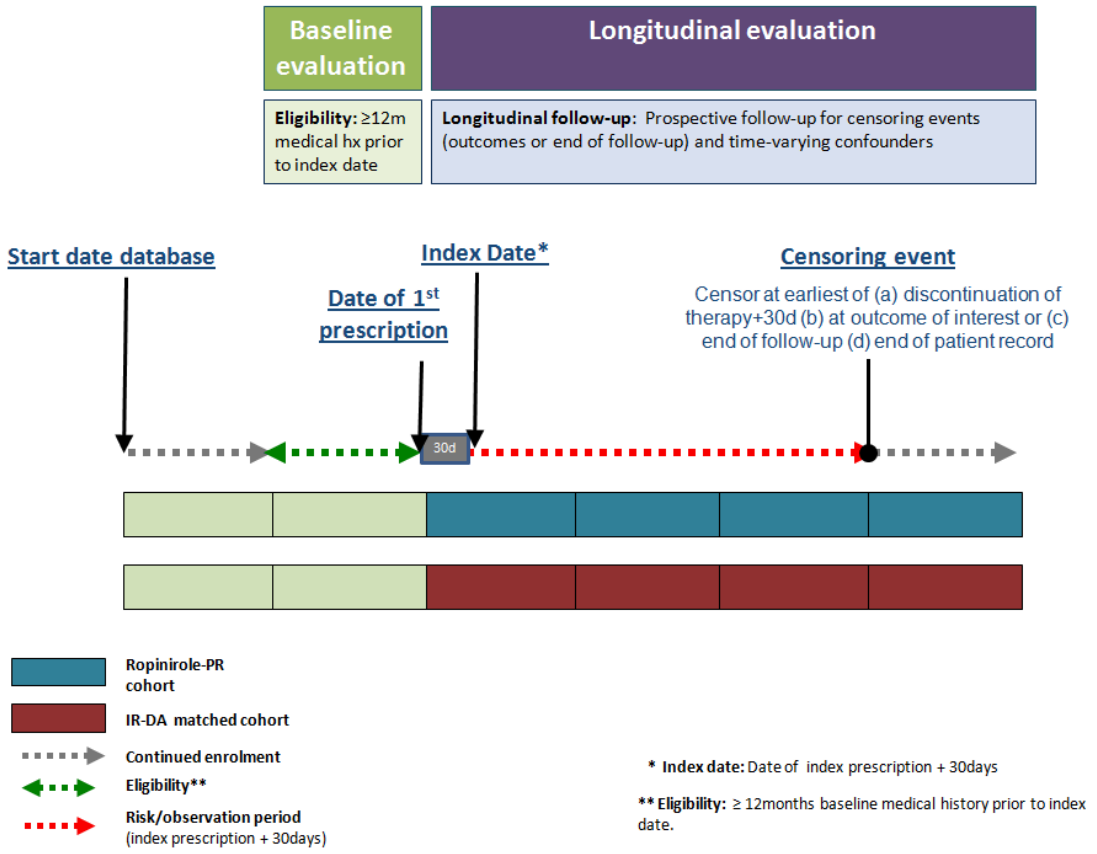
Figure 2 Populations of interest for longitudinal evaluation (DA monotherapy; ropinirole-PR and propensity score matched immediate release DA)



Factors to be considered in generating the propensity score will include demographics, PD disease duration, morbidity burden and treatment histories up to index date (refer to Section 9.3.3.1). Initiation of levodopa, COMT, decarboxylase inhibitors or MAOB during the observation period will also be accounted for since they are known to prolong the effects of levodopa and hence may modify the risk of some of the outcomes of interest. Compliance and adherence to medication may be greater in individuals prescribed ropinirole-PR compared to immediate release dopamine agonists due to its once a day formulation. Therefore adherence to medication will also be described.

The longitudinal analysis will be conducted amongst those patients initiating ropinirole-PR monotherapy and the IR-DA matched cohort. See Figure 3 below.

Figure 3 Schematic of study design: Longitudinal evaluation of DA monotherapy (ropinirole-PR vs. IR-DA matched cohort)



The observation period will commence from date of initiation of therapy + 30days (index date) and continue up to a censoring event (earliest of discontinuation of therapy +30 days, development of an outcome of interest (dyskinesia, on-off phenomena or impulse control disorder), or end of follow-up on the CPRD) up to a maximum of 5 years of treatment. Follow-up commences 30 days after initiating therapy to allow sufficient exposure to the drug, and to account for instances whereby a patient might be switching from another therapy because of developing an outcome of interest. Similarly this is the justification for censoring patients 30 days after treatment discontinuation.

9.2. Setting

The study population for this study will be comprised of individuals with a recorded Parkinson's disease diagnosis initiating a dopamine agonist therapy between January 1st 2004 and December 31st 2012. Patients will be identified from the CPRD, a UK primary care based electronic health record database. Within the United Kingdom, ongoing

Parkinson's disease treatment is managed in the primary care setting by general practitioners.

9.2.1. Clinical Practice Research Datalink

The CPRD is an observational database of anonymised longitudinal records collected from computerised primary care practices throughout the UK containing all records deemed relevant to patient care. Details of demographics, primary care diagnoses and prescription treatment are routinely recorded by date in individual patient records. Due to the structure of the UK National Health Service, details of referrals, secondary care diagnoses and deaths are also captured. Major events from before computerisation are added retrospectively so that the GP has complete patient records. Data on preventive medicine can also be recorded with laboratory results electronically transferred to many practices. Medical events are automatically coded at entry using the READ coding system.(NIH, 2015). Prescriptions issued by the GP are coded using BNF coding. Each patient within the CPRD is assigned an 'up to standard' date (UTS) when the recording of their details is considered to be of research standard.

Data quality of the CPRD is monitored continuously by MHRA and practices that fail to maintain the required standards are removed from the database. The data is collected from over 400 contributing clinical practices throughout the UK and currently contains around 4 million active patients. The CPRD has been found to be highly representative of the UK general population. Several studies have demonstrated nearly identical age and sex distributions when stratified by geographic region between the CPRD population and the entire UK population. (Walley & Mantgani, 1997) On average, individual patients are followed for more than 6 years.

The latest version of the CRPD available at the time of data analysis will be used.

9.2.2. Populations of interest

To be considered eligible for this study, individuals must first meet the criteria for Parkinson's disease which will be defined using READ codes (Section 9.3.2.1). From this population, individuals initiating a dopamine agonist therapy of interest between 2004 and 2012 will be identified.

From this, the following populations of interest will be derived:

- All individuals initiating ropinirole-PR
    - Individuals initiating ropinirole-PR as monotherapy

- All individuals initiating an oral immediate release DA
    - Individuals initiating an oral immediate release DA as monotherapy.

In addition, a separate population will be identified to evaluate off-label use of ropinirole-PR.

9.2.2.1. PD patients initiating ropinirole-PR

PD patients prescribed ropinirole-PR by their GP will be identified from the CPRD. All individuals that meet the case definition for PD and have least 1 prescription for ropinirole-PR on or after their PD diagnosis date will be considered for inclusion.

Inclusion criteria

i. Patients must meet the case definition of PD.
ii. Individuals must have at least one script for ropinirole-PR between 2004 and 2012 (on or after PD diagnosis date).
iii. Patients must have at least 12 months registration prior to index date in order to collect information on comorbidity, medical and prescription history.

Exclusion criteria

The study population will be redefined for analysis of each outcome of interest to ensure that the population under study is free from that outcome at baseline.

- Exclude patients that belong to practices that are not considered up to research standard on index date.
-
- Exclude individuals with any outcomes of interest (dyskinesia, impulse control, on-off phenomena) on or prior to index date. The study population will be redefined for the analysis of each outcome of interest to ensure that the population under study is free from that outcome at baseline.

9.2.2.2. Ropinirole-PR monotherapy (ropinirole-PR cohort)

A subset of the population above initiating ropinirole-PR as monotherapy. Refer to Section 9.3.2.4 for monotherapy definition.

9.2.2.3. PD patients initiating immediate release dopamine agonists

This group will comprise of Parkinson's disease patients initiating an oral immediate release dopamine agonist between 2004 and 2012. This may include individuals initiating the immediate release formulation of ropinirole. Individuals must not have been prescribed prolonged release formulations of ropinirole or pramipexole prior to index date.

Individuals that subsequently switch to ropinirole-PR during follow-up will enter the ropinirole-PR cohort at the time of switch.

Inclusion

- Individuals meeting the PD case definition and initiating an immediate release formulation of a dopamine agonist of interest (between 2004 and 2012) will be included.
- The index date will be defined as the date the dopamine agonist of interest was initiated.

- Patients must belong to practices that are considered up to research standard on index date.
- Patients must have at least 12 months of registration prior to the index date in order to collect information on disease, comorbidity, medical and prescription history.

Exclusion

- Exclude individuals with exposure to prolonged release dopamine agonists (pramipexole or ropinirole) prior to index date.
- Exclude individuals with any outcomes of interest (dyskinesia, impulse control, on-off phenomena) on or prior to index date. The study population will be redefined for analysis of each outcome of interest to ensure that the population under study is free from that outcome at baseline.

- See Section 9.2.3 relating to matching criteria.

9.2.2.4. Immediate release dopamine agonist monotherapy

A subset of the population above initiating their treatment as monotherapy. Refer to Section 9.3.2.4 for monotherapy definition.

9.2.2.5. Ropinirole-PR off-label population

All individuals on the CPRD with at least one ropinirole-PR prescription (irrespective of age) will be identified. Patients are required to have at least 12 months of medical history prior to the index date in order determine likely indication for prescription for the off-label evaluation. The off-label population will comprise of those without a prior history of PD. The proportion of the off-label population with restless leg syndrome (RLS), fibromyalgia, sexual dysfunction, periodic limb movement disorder (without mention of RLS) will be estimated. In addition the proportion of the off-label population at are aged <18years at index date will be estimated (paediatric population)

9.2.3. Matching Criteria

Up to 3 individuals from the comparator cohort (**IR-DA cohort**) will be matched to each individual in the **ropinirole-PR cohort** using the propensity scores. The matching technique (greedy vs. optimal) is yet to be determined.

Propensity score matching aims to improve comparability between the ropinirole-PR and immediate release DA monotherapy groups at baseline. The propensity score is defined as the conditional probability of being treated given the baseline covariates. The propensity score will be used as a matching variable in order to balance the baseline covariates in the two groups.(D'Agostino, 1998) Trimming of propensity scores may be used to provide additional equipoise between treatment groups as this will exclude those with more extreme propensity score values.

To estimate propensity scores, the distribution of the treatment indicator variable is modelled, given the observed covariates at baseline. SAS unconditional logistic regression models will be used; ropinirole-PR use will be the outcome variable. Each

individual is assigned a probability for receiving ropinirole-PR (propensity score) given factors known at baseline. Propensity scores are then used to match individuals with the same propensity score for ropinirole-PR, however, one will have received ropinirole-PR and the other treated with another dopamine agonist of interest.

Factors (at baseline) to be considered in the propensity score generation are listed in Section 9.3.3.1 and include age at PD diagnosis, PD disease duration, PD medication history and morbidity burden at index date.

When missing values occur on covariates to be used in the propensity score, subjects will be excluded.

The distribution of the propensity scores for each exposure will be plotted, before and after matching. The variation within each group (e.g. the SD) will be compared with the separation between the exposed and unexposed groups (e.g. difference between means) to determine whether an adequate degree of matching has been achieved.

A comparison between baseline factors (including those used to generate the propensity score) between the ropinirole-PR cohort and IR-DA cohort will be made to ensure that the matching was successful in balancing the groups.

All longitudinal analyses will be conducted amongst the **ropinirole-PR monotherapy cohort** and the propensity matched immediate release monotherapy group (**IR-DA matched cohort**).

9.3. Variables

9.3.1. Outcome definitions

Refer to ANNEX 1 for a copy of the GP questionnaire

9.3.1.1. Dyskinesia

Dyskinesia will be identified using data captured on the CPRD using READ codes, as well as by GP questionnaire.

Individuals will be classified as having dyskinesia if:
Dyskinesia = YES on GP questionnaire **or** Where Dyskinesia is not known/blank on the GP questionnaire AND CPRD algorithm = [probable] or [possible + initiation of amantadine+clinical review] For patients where there are conflicting information (i.e. no on GP questionnaire and probable on the CPRD), a review of the patients electronic medical record will be made by the clinical consultant and independently by the safety physician to determine outcome status. Date of dyskinesia is the earliest of the dates cited from either source. In the instance where date of dyskinesia is absent (i.e. if from GP questionnaire only), then patient should be excluded from analysis of that outcome.

READ codes can be found in ANNEX 3.

9.3.1.2. On-off phenomena

READ codes are not specific enough to define on-off phenomena, therefore it will be identified using responses from GP questionnaire alone (ANNEX 1).

Month and year of diagnosis will be obtained via GP questionnaire. If date is absent, then the patient should be excluded from analysis of that outcome.

Should the GP questionnaire response rate substantially differ between exposure groups, this outcome will not be included.

9.3.1.3. Impulse control disorders

The following impulse control behaviours will be defined using data from the CPRD and from GP questionnaire:

i. Compulsive eating
ii. Compulsive shopping
iii. Pathological gambling
iv. Hypersexuality
v. Other impulse control disorder

Individuals will be classified as having an impulse control disorder if:
Response to any ICD question = YES on GP questionnaire **or** ICD response = not known or blank on GP questionnaire AND CPRD algorithm = probable For patients where there are conflicting information (i.e. no on GP questionnaire and probable on the CPRD, a review of the patients electronic medical record will be made by the clinical consultant and independently by the safety physician to determine outcome status. Date of onset of ICD is the earliest of the dates cited from either source. In the instance where date of impulse control disorder is absent (i.e. if from GP questionnaire only), then patient should be excluded from analysis of that outcome.

It is proposed to evaluate the risk of ICD overall. A description of the specific behaviours that have been reported will be described.

READ codes can be found in ANNEX 3.

9.3.1.4. Additional outcomes of interest

Time to levodopa initiation

Time to levodopa use amongst individuals without a history of use of levodopa at baseline will be evaluated in both cohorts. As levodopa is associated with dyskinesias, delay in its use may further reduce the risk of the development of motor complications, or reflect better control of PD symptoms by current therapy.

BNF codes will be used to identify levodopa containing medications. (ANNEX 3)

Duration of treatment persistence

Persistence is defined as time from initiation to discontinuation of therapy (a gap in treatment of at least 60 consecutive days). This will be monitored based on prescriptions issued within the CPRD.

The duration of treatment will be derived from either days supply, or pack size divided by the indicated number of tablets to be taken per day. Some patients may have overlapping prescriptions as prescriptions may be issued prior to the previous prescription ending, in these instances, prescriptions can be assumed immediately follow the previous one.

Adherence

The medication possession ratio (MPR) will be used to describe adherence to medication.

This will be calculated by summing the days supply from the first to the last prescription (inclusive) divided by time between the last prescription date plus days supply and the first prescription date.

The following categories of MPR will be created:

- <30%
- 30-50%
- 51-80%
- >=80%

Off-label use of ropinirole-PR

Amongst individuals prescribed ropinirole-PR, diagnoses (defined by READ codes) any time prior to index date will be evaluated to determine likely indication for treatment. The proportion of individuals with any of the following conditions on or prior to index date will be evaluated:

- Parkinson's disease

Then, amongst those without a history of PD:

- Restless legs syndrome (RLS)
- Fibromyalgia
- Periodic limb movement disorder (PLMD) without mention of RLS
- Sexual dysfunction
- Individuals initiating therapy without any history of the mentioned conditions, will be coded as "other".

READ codes have been reviewed by a clinician at GSK can be found in ANNEX 3

Ropinirole daily dose amongst switchers from ropinirole-IR to ropinirole-PR

Individuals that have switched from the immediate release to the prolonged release formulation of ropinirole will be identified. Switchers will be defined as the subset of the ropinirole-PR population that have at least one script for ropinirole-IR formulation in the one month period prior to index date. The difference between the average daily dose of the last ropinirole-IR script and first ropinirole-PR will be calculated.

The average prescribed daily dose will be calculated based on tablet strength, prescription duration and number of daily tablets per prescription.

- Days' supply: if not stated, then divide total quantity by the quantity prescribed per day.
- Daily dose: multiply the quantity prescribed per day by the dose of the tablets
- Where two scripts are given on the same day (different strengths), assume that the doses are additive (i.e. 2mg and 4mg on same day = 6mg). For instances where the patients have two scripts for the same dose on the same day (i.e. separate

entries for 2 sets of 2mg), these should be flagged. Additional review will be required to determine whether these are additive or not based on data captured on the CPRD.

The number of patients missing dose information will be described.

9.3.2. Exposure definitions

9.3.2.1. Parkinson's disease population (PD)

Parkinson's disease will be defined using READ codes captured on the CPRD. READ codes for Primary/idiopathic Parkinson's disease patients can be found in ANNEX 3.

The date of PD diagnosis will be derived using an algorithm based approach (ANNEX 3)

9.3.2.2. Ropinirole-PR

BNF codes will be used to identify ropinirole-PR prescriptions. These codes have undergone review by a clinician at GSK. These codes will be reviewed prior to starting the study to ensure that the list of codes is complete. (ANNEX 3)

The index date will be defined as date of initiation of the ropinirole-PR therapy + 30 days.

9.3.2.3. Oral immediate release dopamine agonists

BNF codes will be used to identify prescriptions for dopamine agonists that are oral and immediate release formulations. These include both ergot and non-ergot dopamine agonists, and will also include individuals prescribed immediate release formulation of ropinirole. Initiators of therapy will be included.

BNF codes have undergone review by a clinician at GSK. (ANNEX 3).

Index date will be date of initiation of the dopamine agonist therapy + 30 days.

9.3.2.4. Dopamine agonist monotherapy definition

Monotherapy is defined dopamine agonist use without concurrent levodopa use, or dopamine agonist use without a history of levodopa use prior to dopamine agonist initiation.

9.3.2.5. Adjunctive use of dopamine agonist definition

Adjunctive therapy is defined as concurrent use (overlapping prescriptions/exposures) of a dopamine agonist with levodopa at the time of dopamine agonist initiation.

9.3.3. Confounders and effect modifiers

Potential confounders include age, sex, duration of PD, year of first dopaminergic prescription

Additionally, as the risk of motor fluctuations such as dyskinesias increases with advancing disease state, PD duration at index date will also be determined using data on the CPRD.

The table below outlines the covariates of interest.

9.3.3.1. Baseline covariates

The following covariates are based on data captured on the CPRD up to and including index date.

Covariate	From GP questionnaire	Comments
Demographics and baseline health state		
Age at index date		Age at initiation of medication of interest. Consider using age at index date or PD duration at index date. (age ± 5yrs)
Age at PD diagnosis		(age ± 5yrs)
Gender		
Disease state (early or advanced) at baseline	X	To be obtained from GP questionnaire and will be based on whether a patient experienced motor fluctuations at index date.
Socioeconomic status (practice level)		
Mean number of GP consultations in 12 months to index date		
Charlson comorbidity score		Charlson comorbidity score at baseline – based on full available medical history at index date. Scoring: Comorbidity Component (Apply 1 point to each unless otherwise noted). 1. **Myocardial infarction** 2. **Congestive heart disease** 3. **Peripheral vascular disease** 4. **Cerebrovascular disease** 5. **Dementia** 6. **COPD** 7. **Connective tissue disease** 8. **Peptic ulcer disease** 9. **Diabetes mellitus** (1 point uncomplicated, 2 points if end-organ damage)

Covariate	From GP questionnaire	Comments
		10. **Moderate to severe chronic kidney disease** (2 points) 11. **Hemiplegia** (2 points) 12. **Leukemia** (2 points) 13. **Malignant lymphoma** (2 points) 14. **Solid tumor** (2 points, 6 points if metastatic) 15. **Liver disease** (1 point mild, 3 points if moderate to severe) 16. **Aids** (6 points) See ANNEX 3 – READ codes to be defined.
Hypertension		READ diagnosis code or receiving treatment for hypertension – ANNEX 3
Type 2 diabetes		READ diagnosis code or receiving treatment for T2D – ANNEX 3
Hypercholesteraemia		READ diagnosis code or receiving a statin – ANNEX 3
Respiratory illness		COPD, asthma
History of psychiatric disease		ANNEX 3
Index year		
Duration of PD at index date		Time from PD diagnosis date to index date
PD medication history up to and including index date		
Duration of PD treatment		Time in years from first ever dopaminergic therapy to index date.
MAOB-I use		Any history of MAOB-I use up to index date (see ANNEX 3 for code) MAOB-I inhibits an enzyme that breaks down dopamine in the brain. It can be used on its own in the early stages of the condition or in conjunction with levodopa . In this situation, it reduces the required dosage and prolongs the action of the levodopa.
Type of first line therapy used		Dopamine agonist or levodopa **not applicable to longitudinal evaluation**
Number of distinct dopaminergic therapies used up		Based on generic name. To identify frequent switchers of PD treatment.

Covariate	From GP questionnaire	Comments
to index date		Also use to identify whether specific treatment is first line therapy or not.
History of levodopa use up to index date		Ever use – Y/N and total duration of levodopa use up to index date (months). **not applicable to longitudinal evaluation**
Amantadine use		**Any history of amantadine use up to index date** Amantadine can be prescribed as a monotherapy to provide relief of symptoms of mild, early-stage PD. It may also be prescribed concomitantly with dopaminergic therapies during the later stages of Parkinson's disease to control involuntary movements (dyskinesias). (see ANNEX 3 for code)
COMT or Decarboxylase inhibitor ever used on or prior to index date		(see ANNEX 3 for code)
Apomorphine use on or prior to index date		(see ANNEX 3 for code)

9.3.3.2. Time varying covariates

Since long-term levodopa use is associated with an increased risk of dyskinesias, initiation of levodopa during follow-up will be captured.

Use of medications such as COMT inhibitors, decarboxylase inhibitors or use of an MAO-B inhibitor prolong the action of levodopa and dopamine respectively, and it is therefore proposed that use of these medications during the period of follow-up will also be accounted for in the analysis

An estimate of duration of exposure to levodopa, or to a levodopa add-on therapy at the time of censoring will be obtained. This estimate will ideally be based on dates and durations of prescriptions issued during follow-up. Should this prove computationally too complex, it will be based on date first prescription and censoring date, otherwise exposure to these may be coded as a binary variable (ever exposed or not exposed during follow-up) to simplify this further.

Time varying covariates include:

- Initiation of a levodopa containing therapy during follow-up
- Initiation of a COMT inhibitor or decarboxylase inhibitor during follow-up
- Initiation of an MAOB-I during follow-up

BNF codes can be found in ANNEX 3

9.4. Data sources

This study will be conducted using data recorded on the CPRD and supplemented by information to be obtained by GP questionnaire. A pilot study conducted in 2010 confirmed that this was a suitable data source to collect data on exposures and outcomes of interest. Refer to ANNEX 1 for a description of the pilot study findings.

9.4.1. Validity of using READ codes to identify individuals with Parkinson's disease

In the UK, patients with suspected Parkinson's disease are referred by their GP to a specialist (neurologist or a geriatrician with a special interest in Parkinson's disease) where a diagnosis is made and treatment initiated. Patients usually have follow-up visits with the specialist every 6-12 months, however ongoing patient management (including repeat prescriptions) occurs in the primary care setting in coordination with a PD nurse specialist.

The pilot study conducted by GSK found that use of READ codes to identify patients was good; 40 out of the 41 cases included in the pilot study were correctly identified as PD using READ codes.

PD diagnosis date will be derived based on the earliest of PD READ code, PD medication or PD symptomatology to determine PD diagnosis date. In the pilot study, this provided a more accurate estimate of PD diagnosis date than PD READ code alone. .

9.4.2. Capture of PD medication use in the primary care setting

Although PD treatment is initiated by a specialist, ongoing treatment (including repeat prescriptions) is managed in the primary care setting; therefore it is believed that the CPRD will adequately capture ongoing treatment of PD patients.

It is important to note that although prescriptions may be issued by a GP, this does not mean that a patient filled their prescription or took their medications as instructed.

9.4.3. Validity and justification for choice of outcomes of interest

A pilot study was conducted to evaluate outcomes based on data captured on the CPRD with those reported via a GP questionnaire. Individuals in the pilot study included individuals with Parkinson's disease, some of whom had an outcome of interest as defined by the presence of READ codes.

Questions were included on the GP questionnaire which required the GP to note the presence or absence of the outcomes and the date of onset of the outcome. The outcomes of interest that were evaluated as part of the pilot study were dyskinesia, end of dose wearing off, sudden onset of sleep and impulse control disorders. Comparisons were made between data captured on the CPRD with GP responses.

Based on findings from the pilot study, it was deemed that it would not be feasible to include end of dose wearing off or sudden onset of sleep as outcomes in the study. Reasons for this include, a poor response to the question by GPs questionnaire, a lack of appropriate medical codes available on the CPRD and substantial conflicting results between CPRD and GP questionnaire, meaning that the validity of the outcome would be questionable.

Refer to ANNEX 1 for details of the pilot study.

9.5. Study size

A Cox regression of the log hazard ratio on a covariate with a standard deviation of 0.5000 based on a sample of 1000 observations, based on independent sampling of the exposure groups (i.e. no matching) achieves 82% power at a 0.05 significance level to detect a regression coefficient equal to 0.4055. The sample size was adjusted for an anticipated event rate of 0.2000. It is hoped that in the present study the use of matched samples will give some additional power.

Cox Regression Power Analysis

Numeric Results

Power	Sample Size (N)	Reg. Coef. (B)	S.D. of X1 (SD)	Event Rate (P)	R-Squared X1 vs Other X's (R2)	Two-Sided Alpha	Beta
0.81789	1000	0.4055	0.5000	0.2000	0.0000	0.05000	0.18211
0.93964	1500	0.4055	0.5000	0.2000	0.0000	0.05000	0.06036

A recent feasibility assessment identified 577 individuals initiating ropinirole-PR as monotherapy and 1660 initiating an immediate release dopamine agonist monotherapy on the CPRD. Up to three comparators will be matched to each ropinirole-PR monotherapy patient. An anticipated GP response rate is 68%, this estimate is based on the response rate achieved in the pilot study.

Report Definitions
Power is the probability of rejecting a false null hypothesis. It should be close to one.
N is the size of the sample drawn from the population.
B is the size of the regression coefficient to be detected
SD is the standard deviation of X1.
P is the event rate.
R2 is the R-squared achieved when X1 is regressed on the other covariates.
Alpha is the probability of rejecting a true null hypothesis.

Beta is the probability of accepting a false null hypothesis.

9.6. Data management

The study will be performed by the Worldwide Epidemiology department of GlaxoSmithKline using in-house full-featured CPRD data. The analysis will be conducted and quality checked in-house by a named programmer and QC analyst who will be dedicated to this study. This project will be managed by the neurosciences epidemiology team. The data derived from the CPRD database will be held in-house on a secure network server with restricted access.

GP questionnaires will be managed and collated by the MHRA and sent to GSK with the patient identifiers removed. Data from GP questionnaire will be linked to CPRD records, and will remain anonymised.

All data will be stored on secure servers.

9.6.1. Data handling conventions

All data handling and data analysis will be performed by a trained analyst from the Observational Data Analytics group within the Worldwide Epidemiology Department. The data will be extracted from the CPRD and maintained as a SAS dataset in the WWEpi UNIX project area. The MHRA will manage data collection from the GP questionnaire; these will be anonymised and provided to GSK.

9.6.2. Resourcing needs

- A principal programmer will be assigned to this project together with a QC analyst who will independently programme the study.
- A named statistical consultant will provide support as needed.
- Input from the safety physician will be required when reviewing discordant outcomes between the CPRD and GP questionnaire. The physician will not be informed of the exposure status of the individuals to minimise bias.

9.6.3. Timings of Assessment during follow-up

Described elsewhere

9.7. Data analysis

All analyses will be conducted in SAS version 9.3.

9.7.1. Overview of statistical techniques

9.7.1.1. Descriptive and univariate analyses

Normally distributed continuous variables will be presented as mean ± standard deviation (SD) and skewed data as median (inter quartile range). Comparisons of continuous

variables between the exposure groups will be evaluated using the Student's t-test and categorical data are to be evaluated using a chi-squared test with Yate's correction or by Fisher's exact test depending on the sample sizes. For the univariable analyses a two-sided p-value of 0.05 will be considered to be statistically significant.

A paired sample t-test will be used to assess whether patients prescribed ropinirole-IR who switch to ropinirole-PR, switch to an equivalent daily dose.

9.7.1.2. Incidence estimation

The incidence of newly diagnosed dyskinesia (and other outcomes of interest) events after the index date will be calculated as the number of events per total number of person-years (PY) of follow-up (per 1000 person-years) in individuals in the ropinirole-PR cohort compared to those in the IR-DA matched cohort. In these cohorts, patients will be followed for events until the earliest of an outcome of interest, discontinuation of therapy+30days, end of a patient record or end of the study period. Crude incident rates per 1000 PY with exact Poisson 95%CI for each type of outcome will be calculated.

Incidence rates will be stratified by age group (at index date) and PD duration,. Incidence rate ratios (IRR) will be estimated between the exposure groups and adjusted for risk factors using multivariable Poisson regression

In addition, incidence rates amongst switchers to ropinirole-PR and those initiating ropinirole-PR *de novo* (as a first line therapy) will be estimated. Should the 95% CI of the IRR not include 1, then consideration will need to be given with regards to differential underlying risk of the outcome amongst these two groups.

9.7.1.3. Multiple regression analyses - Cox proportional hazards regression

A Cox proportional hazards regression model will be used to evaluate time to dyskinesias in individuals prescribed ropinirole-PR with those prescribed other dopamine agonists of interest. Patients will be followed up from index date (initiation of treatment) up to a censoring event (see Section 9.7.1.4). A diagnostic test will be done of the proportional hazards assumption, by adding an exposure x time interaction term to the model.

Crude hazard ratios and 95% CI will be estimated amongst individuals who are free from the outcome of interest at baseline and meeting all inclusion criteria in the two groups of interest (**ropinirole PR cohort** and the **IR-DA matched cohort**). Adjusted hazards ratios will be estimated, accounting for potential confounders and time varying covariates.

Matching will be defined as a stratum variable using a STRATA statement in the SAS procedure, PROC PHREG. The follow-up time for a matched set will continue as long as there is at least one case and one matched control in the analysis.

9.7.1.4. Censoring

- Follow-up will continue to the earliest of: the recording of the outcome of interest, discontinuation of therapy+30days, end of a patient record or end of CPRD follow-up up to a maximum of 5 years of treatment.

- For the estimation of incident rate ratios for those continuing therapy for up to 1, 3 and 5 years, censoring will occur at the end of each of those time points.

9.7.2. Essential analysis

Please refer to standalone document in ANNEX 1 for table shells.

Objective: To describe and compare the baseline characteristics of individuals with Parkinson's disease initiating ropinirole-PR with those initiating immediate release formulation dopamine agonists.

OUTPUT 1: Figure 1 - Derivation of initial study population

Schematic showing derivation of initial study population following application of inclusion and exclusion criteria.

OUTPUT 2: Figure 2 - Derivation of study population for longitudinal analysis

Schematic showing derivation of the two populations of interest for the longitudinal analysis; ropinirole-PR cohort, IR-DA (unmatched) and the matched IR-DA cohort)

OUTPUT 3: Propensity score

- Description of factors used to generate the score
- Distributions of scores for both groups, and matched group (distribution plot, plus quintiles)
- A description of the number of ropinirole-PR patients that were unmatched (no suitable comparator)
- In addition, a count and descriptive analysis of individuals that were not able to be matched that were prescribed ropinirole-PR.

OUTPUT 4: Table 1 - Baseline characteristics of populations of interest before matching

A descriptive analysis of the patient characteristics at index date amongst:

- Ropinirole-PR cohort
- IR-DA (unmatched)

Covariates to include those listed in Section 9.3.3.1. and include patient demographics, disease duration, PD treatment history and comorbidity burden.

OUTPUT 5: Table 2 - Baseline characteristics of populations of interest after matching

As per output 4, but instead comparing the following populations:

- Ropinirole-PR cohort
- IR-DA matched cohort

In addition a count of the number of individuals that was not possible to match.

OUTPUT 6: Table 3 - Average daily dose of ropinirole amongst individuals switching from IR to PR formulation

Amongst individuals that switched from the IR to the PR formulation of ropinirole-PR, the difference between average daily dose pre and post switch.

Population: PD patients initiating ropinirole-PR that switched from ropinirole-IR

Exposure categories:

- Parkinson's disease patients initiating ropinirole-PR as monotherapy
- Parkinson's disease patients initiating ropinirole-PR adjunctive to levodopa
- Parkinson's disease patients initiating ropinirole-PR (monotherapy or adjunctive use)

Outputs:

- Average daily dose at last prescription of ropinirole-IR (prior to switch to ropinirole-PR)
- Average daily dose of ropinirole-PR at time of switch

Objective: To estimate the incidence of dyskinesia and other outcomes of interest amongst individuals with Parkinson's disease initiating ropinirole-PR compared to a propensity score matched cohort of individuals initiating immediate release formulations of dopamine agonists as monotherapy

Populations of interest (exposure groups) for the longitudinal analysis are:

- Ropinirole-PR cohort
- IR-DA matched cohort

Outcomes of interest: Dyskinesia, on-off phenomena, impulse control disorders, initiation of levodopa.

The following outputs will be required for **each** outcome of interest

OUTPUT 7: Table 4: Incidence of outcome of interest

- Incidence (per 1,000 person-years) stratified by age group (at index date), gender, PD duration.
- Crude and adjusted incidence rate ratios
- Crude incidence for those continuing therapy for 1, 3 and 5 years respectively (i.e. for this estimation only, censor at year 1, 3 and 5 respectively)

Separate tables required for each outcome of interest.

OUTPUT 8: Table 5 Median time to outcome.

- Median time (days) from initiation of therapy to onset of outcome amongst the ropinirole-PR cohort and IR-DA matched cohort

OUTPUT 9: Cox proportional hazards model

- Crude and adjusted hazards ratio for exposure groups of interest, accounting for initiation of levodopa or levodopa add-on therapies during follow-up (Section 9.3.3.2) when evaluating dyskinesia, impulse control disorders and on-off phenomena.
- Kaplan-Meier survival curves for patients in the ropinirole-PR and matched immediate release DA cohorts.

Refer to Section 9.3.3.1 for list of potential covariates to consider for adjustment. When evaluating time to levodopa use as an outcome, there is no need to account for time varying-covariates.

Objective: To describe treatment persistence and adherence amongst patients initiating therapy on ropinirole-PR versus a matched cohort initiating immediate release dopamine agonists

Populations of interest (exposure groups):

- Ropinirole-PR cohort
- IR-DA matched cohort

OUTPUT 10: Table 6 - Duration of treatment persistence and medication possession ratio amongst the ropinirole-PR and IR-DA matched cohorts.

OUTPUT 11: Kaplan-Meier plot – medication persistence between exposure groups (ropinirole-PR and IR-DA matched cohorts).

Objective 4: Evaluation of off-label use of ropinirole-PR

OUTPUT 12: Figure 3 – extent of off label use of ropinirole-PR

Population of interest – Ropinirole-PR off-label population

Schematic showing derivation of off-label population, and probable indication of ropinirole-PR treatment

9.7.3. Exploratory analysis

- **OUTPUT 13: Table 7 - incidence of [dyskinesia etc] per 1,000 person-years for patients initiating ropinirole-PR as a first line monotherapy and those prescribed ropinirole-pr switching from another dopamine agonist**

  Patients may switch therapies due to inadequate control of PD symptoms, onset of motor complications or due to poor tolerability of medication. It is possible that these reasons may be not be recorded by the GP. In this study, patients may have switched from another dopamine agonist therapy prior to switching to ropinirole-PR, it is therefore proposed to estimate the risk of the outcomes of interest amongst the subset of the population that are initiating their ropinirole-PR as first line therapy as compared to those switching from other dopamine agonist therapies.

- **OUTPUT 14 and OUTPUT 15: Table 8, and Table 9 – sensitivity analysis – evaluation of risk of dyskinesias amongst individuals with at least two consecutive prescriptions.**

  It is possible that a single script being issued may not represent a medicine having been taken by a patient. Therefore a sensitivity analysis including individuals with at least two consecutive scripts will be conducted when evaluating dyskinesia as an outcome.

- Dose of treatment has not been accounted for in the analyses. A stratified analysis by dose of treatment may be considered for each main outcome; this is dependent upon the extent of missing dose data on the CPRD.

9.7.4. General considerations for data analyses

Two approaches will be used to adjust for potential confounders: propensity score matching and covariate adjustment. These have been discussed in the statistical analysis section.

Colinearity: There are a number of factors that may be highly correlated, for example PD disease duration and duration of PD treatment up to index date. Following inspection of

the intermediate results, it is proposed that one or the other may be dropped from multiple regression models.

9.8. Quality control

The study protocol has undergone internal GSK review by epidemiology, statistics, clinical and observational database experts at the epidemiology Protocol Review Forum (PRF).

All analyses will be conducted according to internal quality control procedures.

9.9. Strengths of data source

The CPRD is an electronic source of medical records and prescriptions that has been designed for epidemiologic research. The average duration of follow-up of patients is sufficiently long allowing the long-term evaluation of patients prescribed dopamine agonist therapy for treatment of their Parkinson's disease. The CPRD population closely matches the age and gender distribution of the UK population and represents clinical practice as it occurs in the real-world; our findings are therefore generalisable to ropinirole PR use as it occurs in the UK primary care population. As the CPRD contains medical diagnoses deemed relevant to patient care, we are able to take into account a number of baseline factors in our analysis, as well as being able to evaluate off-label use of the drug.

9.10. Limitations of the research methods

The use of administrative data of this type carries some limitations. A primary limitation is our limited ability to control for confounding. Matching by use of propensity scores will help ensure that the exposure groups are comparable at baseline, however, we are only able to control for potential confounders that are contained within the CPRD data. GP's choice of therapy may be influenced by a number of factors such as the severity of PD symptoms at baseline, which is not measurable using data from the CPRD.

The CPRD is representative of patient care as provided by GPs in the primary care setting. In the UK, PD patients are initially assessed and prescribed therapy by Neurologists or PD Nurse Specialists, however, it is believed that ongoing therapy is managed in primary care. The CPRD will not therefore capture prescriptions issued by specialists, however subsequent prescriptions will be

There is the possibility of enhanced GP ascertainment/ patient reporting of compulsive behaviours among dopamine agonist users because of media attention related to this class of drug. However, this should not affect our ropinirole-PR vs. other dopamine agonists comparison.

Our study will only follow patients as far back as they were registered with an up-to-standard CPRD practice to obtain information on prior dopamine agonist prescriptions and medical diagnoses. We may be missing some events in the study groups that had occurred further back in time, but their effect on the baseline risk of dyskinesias or other adverse outcomes is likely to be minimal. Dose of treatment has not been accounted for;

if it is feasible to evaluate this (based on the extent of missing dose data), then this may be conducted as part of the exploratory analyses. Finally, we are using prescriptions received as a proxy for treatment compliance. This merely represents prescriptions given to the patient and does not represent dispensed prescriptions. It is therefore possible that some patients are not taking their medications, but are still receiving prescriptions. Again, this occurrence should be non-differential across our treatment groups, however may vary by age of patient.

GP response rate of around 68% is anticipated based on findings from the pilot study. Presence of on-off phenomena will be determined based on GP questionnaire response alone. Should any significant differences in GP response rate between exposure groups be observed, then it may not be feasible or appropriate to include this as an outcome of interest.

Due to the age of PD patients and course of disease, loss-to-follow up due to death or move to secondary care facilities will need to be monitored as this will impact sample size.

9.10.1. Study closure/uninterpretability of results

As mentioned elsewhere, should there be an imbalance of GP questionnaire response rate between exposure groups or a poor GP response rate, then outcomes such as on-off phenomena may be omitted from this study. GSK will communicate such findings to the MHRA.

9.11. Other aspects

Not applicable

10. PROTECTION OF HUMAN SUBJECTS

10.1. Ethical approval and subject consent

Independent Scientific Advisory Committee (ISAC) approval will be sought prior to finalising the protocol. The data analyses can start only after ISAC approval is granted.

10.2. Subject confidentiality

The CPRD has removed all patient identifiers ensuring patient confidentiality. The MHRA will be responsible for contacting GPs via a questionnaire, and collating the responses, GSK will not have access to potentially patient identifiable information.

11. MANAGEMENT AND REPORTING OF ADVERSE EVENTS/ADVERSE REACTIONS

If, during the study, an adverse event (serious or non serious) is identified as explicitly attributed to any GSK product (including products not covered in the specific study objective), this will be reported. The study epidemiologist must forward the report to

GSK central safety department within 24 hours of first becoming aware of the event as per SOP 52214 (Reporting and Disclosing Information from Observational Safety Studies and Analyses of Epidemiology Data).

When conducted by a third party, the adverse event must be faxed to GSK Global Clinical Safety and Pharmacovigilance at [redacted] within 24 hours of receiving the information.

In addition, GSK will evaluate the feasibility of investigating the association of newly reported potential adverse events using the CPRD dopamine agonist cohorts described should they arise or be identified from spontaneous reporting or elsewhere.

12. PLANS FOR DISSEMINATING AND COMMUNICATING STUDY RESULTS

12.1. Target Audience

Findings from this study will be shared internally to GSK stakeholders (including but not limited to the ropinirole Safety Review Team, Project Team and Regulatory Team). The results will be disseminated externally via regulatory submission to the MHRA as well as, manuscript.

12.2. Study reporting and publications

The results of the study will be disseminated through abstract submissions, publishing in a peer reviewed journal and posting on publically accessible GSK website.

15. ANNEX 2.ENCEPP CHECKLIST FOR STUDY PROTOCOLS

Section 1: Research question	**Yes**	**No**	**N/A**	**Page Number(s)**
1.1 Does the formulation of the research question clearly explain:				
1.1.1 Why the study is conducted? (e.g. to address an important public health concern, a risk identified in the risk management plan, an emerging safety issue)	☒	☐	☐	19
1.1.2 The objectives of the study?	☒	☐	☐	19
1.2 Does the formulation of the research question specify:				
1.2.1 The target population? (i.e. population or subgroup to whom the study results are intended to be generalised)	☒	☐	☐	20
1.2.2 Which formal hypothesis(-es) is (are) to be tested?	☒	☐	☐	19
1.2.3 if applicable, that there is no *a priori* hypothesis?	☐	☐	☒	

Comments:

Section 2: Source and study populations	**Yes**	**No**	**N/A**	**Page Number(s)**
2.1 Is the source population described?	☒	☐	☐	20
2.2 Is the planned study population defined in terms of:				
2.2.1 Study time period?	☒	☐	☐	20

Section 2: Source and study populations	**Yes**	**No**	**N/A**	**Page Number(s)**
2.2.2 Age and sex?	☒	☐	☐	22
2.2.3 Country of origin?	☒	☐	☐	22
2.2.4 Disease/indication?	☒	☐	☐	20
2.2.5 Co-morbidity?	☐	☐	☒	
2.2.6 Seasonality?	☐	☐	☒	
2.3 Does the protocol define how the study population will be sampled from the source population? (e.g. event or inclusion/exclusion criteria)	☒	☐	☐	23

Comments:

Section 3: Study design	**Yes**	**No**	**N/A**	**Page Number(s)**
3.1 Does the protocol specify the primary and secondary (if applicable) endpoint(s) to be investigated?	☒	☐	☐	26
3.2 Is the study design described? (e.g. cohort, case-control, randomised controlled trial, new or alternative design)	☒	☐	☐	20
3.3 Does the protocol describe the measure(s) of effect? (e.g. relative risk, odds ratio, deaths per 1000 person-years, absolute risk, excess risk, incidence rate ratio, hazard ratio, number needed to harm (NNH) per year)	☒	☐	☐	37
3.4 Is sample size considered?	☒	☐	☐	35
3.5 Is statistical power calculated?	☒	☐	☐	35

Comments:

Section 4: Data sources	**Yes**	**No**	**N/A**	**Page Number(s)**
4.1 Does the protocol describe the data source(s) used in the study for the ascertainment of:	☒	☐	☐	30
4.1.1 Exposure? (e.g. pharmacy dispensing, general practice prescribing, claims data, self-report, face-to-face interview, etc)	☒	☐	☐	26
4.1.2 Endpoints? (e.g. clinical records, laboratory markers or values, claims data, self-report, patient interview including scales and questionnaires, vital statistics, etc)	☐	☐	☐	31
4.1.3 Covariates?				
4.2 Does the protocol describe the information available from the data source(s) on:				

Section 4: Data sources	**Yes**	**No**	**N/A**	**Page Number(s)**
4.2.1 Exposure? (e.g. date of dispensing, drug quantity, dose, number of days of supply prescription, daily dosage, prescriber)	☒	☐	☐	30
4.2.2 Endpoints? (e.g. date of occurrence, multiple event, severity measures related to event)	☒	☐	☐	26
4.2.3 Covariates? (e.g. age, sex, clinical and drug use history, co-morbidity, co-medications, life style, etc.)	☒	☐	☐	31
4.3 Is the coding system described for:				
4.3.1 Diseases? (e.g. International Classification of Diseases (ICD)-10)	☒	☐	☐	23
4.3.2 Endpoints? (e.g. Medical Dictionary for Regulatory Activities(MedDRA) for adverse events)	☒	☐	☐	23
4.3.3 Exposure? (e.g. WHO Drug Dictionary, Anatomical Therapeutic Chemical (ATC)Classification System)	☒	☐	☐	23
4.4 Is the linkage method between data sources described? (e.g. based on a unique identifier or other)	☐	☐	☒	

Comments:

Section 5: Exposure definition and measurement	**Yes**	**No**	**N/A**	**Page Number(s)**
5.1 Does the protocol describe how exposure is defined and measured? (e.g. operational details for defining and categorising exposure)	☒	☐	☐	24
5.2 Does the protocol discuss the validity of exposure measurement? (e.g. precision, accuracy, prospective ascertainment, exposure information recorded before the outcome occurred, use of validation sub-study)	☒	☐	☐	34
5.3 Is exposure classified according to time windows? (e.g. current user, former user, non-use)	☒	☐	☐	22
5.4 Is exposure classified based on biological mechanism of action?	☐	☒	☐	
5.5 Does the protocol specify whether a dose-dependent or duration-dependent response is measured?	☒	☐	☐	41

Comments:

Section 6: Endpoint definition and measurement	**Yes**	**No**	**N/A**	**Page Number(s)**
6.1 Does the protocol describe how the endpoints are defined and measured?	☒	☐	☐	26
6.2 Does the protocol discuss the validity of endpoint measurement? (e.g. precision, accuracy, sensitivity, specificity, positive predictive value, prospective or retrospective ascertainment, use of validation sub-study)	☒	☐	☐	34

Comments:

Section 7: Biases and Effect modifiers	**Yes**	**No**	**N/A**	**Page Number(s)**
7.1 Does the protocol address:				
7.1.1 Selection biases?	☒	☐	☐	42
7.1.2 Information biases?	☒	☐	☐	42
(e.g. anticipated direction and magnitude of such biases, validation sub-study, use of validation and external data, analytical methods)				
7.2 Does the protocol address known confounders? (e.g. collection of data on known confounders, methods of controlling for known confounders)	☒	☐	☐	31
7.3 Does the protocol address known effect modifiers? (e.g. collection of data on known effect modifiers, anticipated direction of effect)	☒	☐	☐	31
7.4 Does the protocol address other limitations?	☒	☐	☐	25

Comments:

Section 8: Analysis plan	**Yes**	**No**	**N/A**	**Page Number(s)**
8.1 Does the plan include measurement of absolute effects?	☒	☐	☐	37
8.2 Is the choice of statistical techniques described?	☒	☐	☐	37
8.3 Are descriptive analyses included?	☒	☐	☐	37
8.4 Are stratified analyses included?	☒	☐	☐	37
8.5 Does the plan describe the methods for identifying: 8.5.1 Confounders? 8.5.2 Effect modifiers?	 ☒ ☐	 ☐ ☐	 ☐ ☐	 37 37
8.6 Does the plan describe how the analysis will address: 8.6.1 Confounding? 8.6.2 Effect modification?	 ☒ ☐	 ☐ ☒	 ☐ ☐	37

Comments:

Section 9: Quality assurance, feasibility and reporting	**Yes**	**No**	**N/A**	**Page Number(s)**
9.1 Does the protocol provide information on data storage? (e.g. software and IT environment, database maintenance and anti-fraud protection, archiving)	☒	☐	☐	36
9.2 Are methods of quality assurance described?	☒	☐	☐	42
9.3 Does the protocol describe quality issues related to the data source(s)?	☒	☐	☐	23

Section 9: Quality assurance, feasibility and reporting	**Yes**	**No**	**N/A**	**Page Number(s)**
9.4 Does the protocol discuss study feasibility? (e.g. sample size, anticipated exposure, duration of follow-up in a cohort study, patient recruitment)	☒	☐	☐	35
9.5 Does the protocol specify timelines for				
9.5.1 Start of data collection?	☒	☐	☐	14
9.5.2 Any progress report?	☐	☐	☒	
9.5.3 End of data collection?	☒	☐	☐	14
9.5.4 Reporting? (i.e. interim reports, final study report)	☒	☐	☐	14
9.6 Does the protocol include a section to document future amendments and deviations?	☒	☐	☐	14
9.7 Are communication methods to disseminate results described?	☒	☐	☐	44
9.8 Is there a system in place for independent review of study results?	☐	☒	☐	

Comments:

Section 10: Ethical issues	**Yes**	**No**	**N/A**	**Page Number(s)**
10.1 Have requirements of Ethics Committee/Institutional Review Board approval been described?	☒	☐	☐	43
10.2 Has any outcome of an ethical review procedure been addressed?	☐	☒	☐	
10.3 Have data protection requirements been	☒	☐	☐	43

Section 10: Ethical issues	**Yes**	**No**	**N/A**	**Page Number(s)**
described?				

Comments:

16. ANNEX 3.ADDITIONAL INFORMATION

16.1. Dyskinesia

GSK coding library identifier: MCL1802

16.2. Impulse control disorders

GSK coding library identifier: MCL1803

16.3. Parkinson's disease medications

GSK coding library identifier: **MCL1730**

Drug	**GSK Coding library identifier**	**classify**	**Composition**	**Release_time**
levodopa	MCL1730	*Contains* levodopa *		
Oral, immediate release dopamine agonists	MCL1730	Dopamine agonist*		*Does not* = 'modified release' (note retain those where release_time is null or immediate release)
Ropinirole-PR Prolonged release formulation of ropinirole	MCL1730	Dopamine agonist*	*ropinirole*	= 'modified release'

Drug	**GSK Coding library identifier**	**classify**	**Composition**	**Release_time**
Pramipexole-PR Prolonged release formulation of pramipexole	MCL1730	Dopamine agonist*	*pramipexole*	= 'modified release'
COMT	MCL1730	Classify **contains *COMT***		
decarboxylase inhibitor	MCL1730	Classify **contains *decarboxylase***		
MAO-B inhibitor (time varying medication**)**	MCL1730	Classify **contain "MAO B inhibitor"**		
Apomorphine	MCL1730		*apomorphine*	
Amantadine	MCL1730		*amantadine*	

16.4. Off-label indications

GSK coding library identifier: **MCL1805**

16.5. Parkinson's disease population (PD)

Inclusion criteria

1. Primary/idiopathic Parkinson's disease patients will be identified using READ codes outlined below. [GSK coding library identifier: **MCL1690**]

CPRD Medical code	READ Code	Description
9509	Eu02300	[X]Dementia in Parkinson's disease
96860	F11x900	Cerebral degeneration in Parkinson's disease
4321	F12..00	Parkinson's disease
1691	F120.00	Paralysis agitans
14912	F12z.00	Parkinson's disease NOS

2. All individuals in the analyses require at least 12 months of registration prior to the **PD diagnosis date** (see below for algorithm to derive) to allow time for the recording of prevalent events

3. Patients must be aged at least 40 years at the time of PD diagnosis (see algorithm to determine date of PD diagnosis below)

Exclusion criteria

- Patients aged less than 40 years at the time of PD diagnosis.

- Drug induced Parkonsinism (code for drug induced PD or exposure to any prescription for drugs known to induce Parkinsonism in the 3 month period before the Parkinson's disease diagnosis date) [GSK coding library request identifier **MCL1806**]

  Other secondary parkinsonism. (including Malignant Neuroleptic syndrome, Postencephalytic Parkinsonism, Vascular and Syphilitic Parkinsonisms) prior to index date [GSK identifier **MCL1806**]

16.6. Date of PD diagnosis

For individuals fulfilling the PD definition (above) use the earliest of:

- Date of Parkinson's READ or CPRD medical code [GSK identifier: **MCL1690**]
- Dopaminergic therapy (dopamine agonist or levodopa therapy) [GSK identifier: **MCL1730** where classify = dopamine agonist* or levodopa*]
- PD symptomatology (based on READ or CPRD code) were reviewed by a GSK clinical consultant. GSK identifier **MCL1728** – where review = yes.

16.7. Charlson comorbidity score

Codes yet to be defined

16.8. Hypertension

Codes yet to be defined

16.9. Hypercholesteraemia

Codes yet to be defined

16.10. Type 2 diabetes

Codes yet to be defined

16.11. Psychiatric disease

Codes yet to be defined

16.12. Respiratory disease

Codes yet to be defined

CPRD/MHRA Identifiers

Practice ID _____ Patient Identifier _____

This questionnaire is part of a prospective study that is evaluating Parkinson's disease outcomes amongst individuals that have been prescribed a dopamine agonist therapy

In particular we wish you to:

- **Confirm that your patient has previously been diagnosed with Parkinson's disease**
- **Document whether they had evidence of specific conditions of interest, and when.**

If this patient is no longer registered at your practice then please complete Section A only

It is anticipated that the information you provide will be used to verify data already present on the CPRD, as well as providing supplementary information.

Section A: Patient registration

1. Is this patient currently registered at your practice

   Yes ☐ (if Yes, please continue to section B)

   No ☐ (if No, please complete questions 2 and 3)

2. If this patient no longer registered at this practice, please state reason

   Died ☐ **Transferred practice** ☐ **Not known** ☐

3. Year patient ceased being registered at your practice _____

Section B: Patient Baseline Characteristics

4. Please confirm the year the patient was first diagnosed with Parkinson's disease _____

5. Before [**INDEX DATE**] did the patient experience motor fluctuations?* (please tick one):

   Yes ☐ **No** ☐ **Not known** ☐

* **Motor fluctuations** include, reduced duration of anti-parkinsonian action (wearing off phenomenon, end of dose wearing off), sudden shifts between under-treated and over-treated states (on-off phenomenon), freezing and involuntary movements such as dyskinesias

Section C: Follow-up Questions

6. Has this patient experienced symptoms compatible with or receive a diagnosis for any of the following between INDEX YEAR and CENSOR DATE

	Yes	No	NK	Month + Year of diagnosis/presentation[†] (i.e. Feb 2010)
a. Dyskinesias[‡]	☐	☐	☐	_____
b. On-off phenomena[§]	☐	☐	☐	_____
c. Impulse Control Disorders[**]				
Pathological Gambling	☐	☐	☐	_____
Hypersexuality	☐	☐	☐	_____
Compulsive Shopping	☐	☐	☐	_____
Compulsive Eating	☐	☐	☐	_____
Other impulse control disorder	☐	☐	☐	_____

If other impulse control disorder, please specify _____

[†] If month not available, please enter the year only

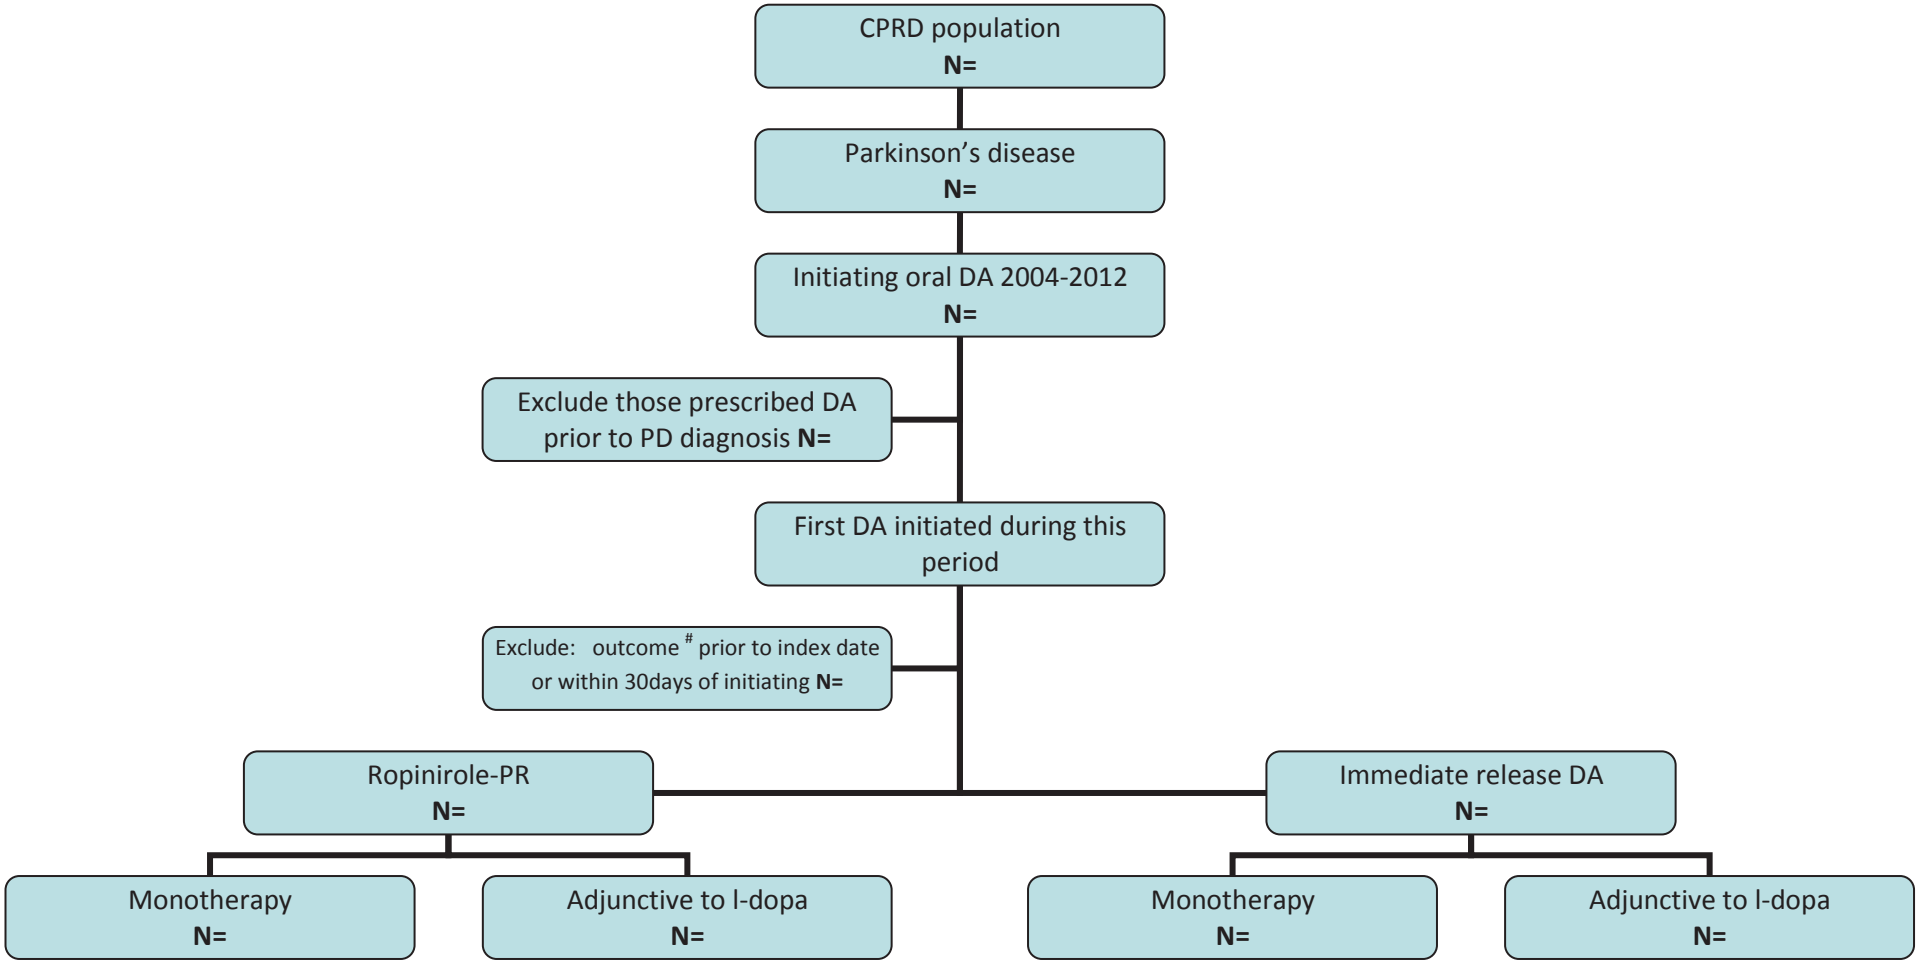
[‡] **Dyskinesia** describes a group of involuntary (non-tremor) movements that appear to be a fragmentation of the normal smoothly controlled limb and facial movements.

[§] **On-off phenomena** (unpredictable on-off) is defined as unpredictable fluctuations between periods of relatively good function and good mobility –'on,' and periods of poor function and poor mobility, immobility or freezing–'off'

[**] **Impulse control disorders** are a class of psychiatric disorders characterised by impulsivity; a failure to resist a temptation, urge or impulse that may harm oneself or others.

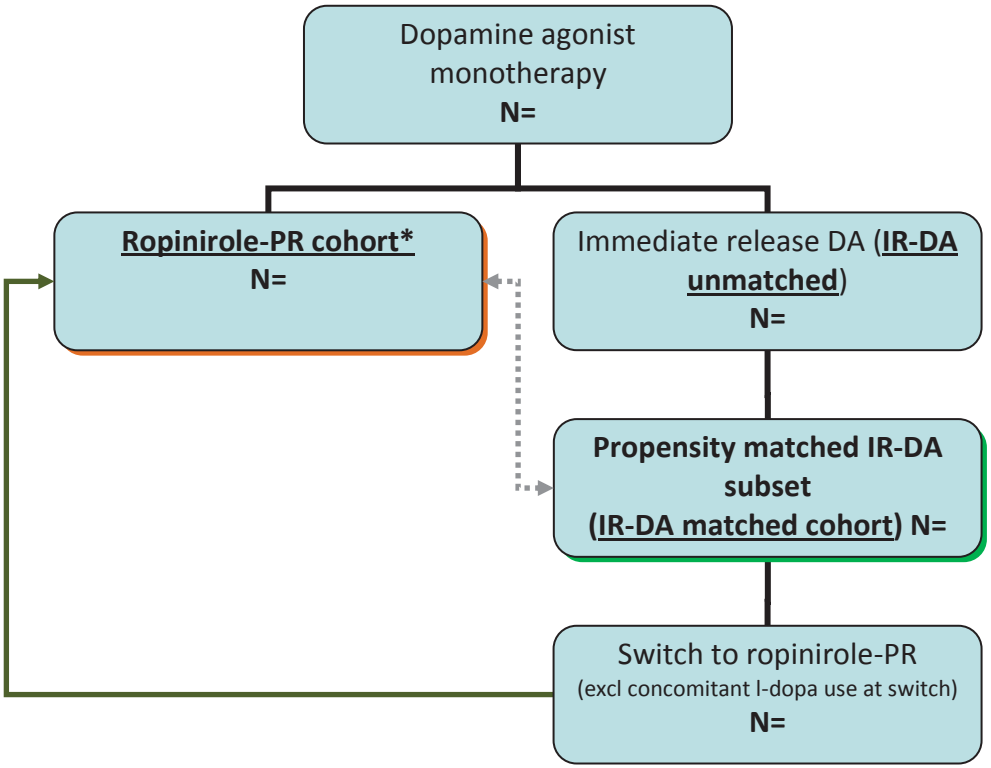
OUTPUT 1: FIGURE 1 - DERIVATION OF STUDY POPULATION

Derivation of initial study population following application of inclusion and exclusion criteria.



Provide a breakdown of the following: Dyskinesia N= , impulse control disorder N= , on-off phenomena N=

OUTPUT 2: FIGURE 2 - DERIVATION OF STUDY POPULATION FOR LONGITUDINAL ANALYSIS



* Comprises of individuals switching from an immediate release dopamine agonist monotherapy as well as those whose first prescription between 2004 and 2012 is ropinirole-PR

OUTPUT 3: PROPENSITY SCORE METRICS

- Plot of distributions of propensity scores for ropinirole-PR, IR-DA (unmatched) and IR-DA (matched.
- Description of factors used to generate the propensity score
- Describe number of ropinirole-PR that were unmatched (no suitable comparator)
- In addition, a descriptive analysis of individuals that were not able to be matched that were prescribed ropinirole-PR (use table shell in output 4).

OUTPUT 4: TABLE 1 - BASELINE CHARACTERISTICS OF POPULATIONS OF INTEREST BEFORE MATCHING

	Ropinirole-PR Ropinirole-PR cohort N=	Immediate release dopamine agonists IR-DA unmatched N=	p-value
Mean age at index date			
Age at PD diagnosis			
Age at index date			
Gender			
% male			
% female			
PD duration (years)			
Index year			
Disease stage at baseline (early, advanced)			
% early			
% late			
% not specified			
First line dopaminergic treatment at time of PD diagnosis (dopamine agonist or Levodopa)			
MAOB-I ever used prior to index date			
COMT ever used prior to index date			
Decarboxylase inhibitor ever used prior to index date			
Amantadine ever used prior to index date			
Number of distinct dopamine agonists used up to index date			
Mean number of GP consultations in 12months to index date			
Charlson comorbidity score at baseline			

OUTPUT 5: TABLE 2 - BASELINE CHARACTERISTICS OF POPULATIONS OF INTEREST AFTER MATCHING

	Ropinirole-PR Ropinirole-PR cohort N=	Immediate release dopamine agonists IR-DA matched N=	p-value
Mean age at index date			
Age at PD diagnosis			
Age at index date			
Gender			
% male			
% female			
PD duration (years)			
Index year			
Disease stage at baseline (early, advanced)			
% early			
% late			
% not specified			
First line dopaminergic treatment at time of PD diagnosis (dopamine agonist or Levodopa)			
MAOB-I ever used prior to index date			
COMT ever used prior to index date			
Decarboxylase inhibitor ever used prior to index date			
Amantadine ever used prior to index date			
Number of distinct dopamine agonists used up to index date			
Mean number of GP consultations in 12months to index date			
Charlson comorbidity score at baseline			

OUTPUT 6: TABLE 3 - AVERAGE DAILY DOSE OF ROPINIROLE AMONGST INDIVIDUALS SWITCHING FROM IR TO PR FORMULATION

	Number of individuals	Average daily dose of IR pre-switch (milligrams)	Average daily dose at switch (milligrams)	p-value
Parkinson's disease patients initiating ropinirole-PR (ropinirole-PR cohort)		-	-	-
Parkinson's disease patients switching from ropinirole-IR to PR amongst:		-	-	-
Parkinson's disease patients initiating ropinirole-PR as monotherapy				
Parkinson's disease patients initiating ropinirole-PR adjunctive to Levodopa				
Parkinson's disease patients initiating ropinirole-PR (all)				

Number of subjects in which dose was missing: N=

OUTPUT 7: TABLE 4 - INCIDENCE OF [DYSKINESIA] PER 1,000 PERSON-YEARS FOR PATIENTS PRESCRIBED ROPINIROLE-PR MONOTHERAPY (ROPINIROLE-PR COHORT) AND THOSE INITIATING AN IMMEDIATE RELEASE DOPAMINE AGONISTS (IR-DA MATCHED COHORT) ON THE CPRD

Summary of findings from a pilot study to assess utility of capturing Parkinson's disease related outcome data by GP questionnaire

In support of the Post marketing study of ropinirole prolonged release tablets: Evaluation of the short term drug utilisation patterns and long term use of ropinirole PR using the CPRD

Overview:

In 2008, GSK was granted approval for the prolonged release formulation of ropinirole (ropinirole PR) for the treatment of Parkinson's disease (PD) by the MHRA.

As part of its post-marketing commitment to the MHRA, GSK proposed to conduct an observational study using the Clinical Practice Datalink (CPRD). The primary aim of this study will be to evaluate long term outcomes amongst individuals prescribedropinirole-PR as compared to those prescribed immediate release dopamine agonists.

A pilot study was conducted together with the University of Bath, to determine whether it was feasible or necessary to supplement information routinely captured on the CPRD relating to outcomes of interest and PD disease stage (early or advanced) and duration by use of a GP questionnaire.

Methods:

Parkinson's disease patients were identified on the CPRD using READ and OXMIS medical codes. All patients were required to have at least 12 months of registration prior to PD index date.

Algorithms were developed together with the University of Bath for each potential outcome of interest. Potential outcomes of interest included dyskinesias, sudden onset of sleep, end-of dose wearing off, on-off phenomenon and impulse control disorders. GSK and the University of Bath independently identified READ and OXMIS codes for each outcome of interest. Codes underwent clinical review at both sites and lists were compared to ensure completeness. For each outcome of interest, clinicians at GSK and at the University of Bath independently assigned the level of certainty associated with each code as 'no', 'possible', 'probable' based on the READ and OXMIS codes.

Questionnaires were sent (via the MHRA) to the GP's of 60 Parkinson's patients identified on the CPRD; 50 of whom had at least one of the potential outcomes of interest recorded on the CPRD and 10 without an outcome recorded on the CPRD. The following baseline and outcome information was requested on the GP questionnaire:

- Baseline data: Confirmation of PD diagnosis, year PD diagnosed, year dopaminergic therapy initiated, motor fluctuations experienced on or prior to initiation of dopamine agonist therapy.

- Outcomes (including date of onset):

- Dyskinesia
- Proportion of waking day with dyskinesia
- End of dose wearing off [1]
- On-off phenomena
- Proportion of waking day off
- Sudden onset of sleep (during day)
- Impulse control disorders (pathological gambling, hypersexuality, compulsive shopping, compulsive eating, other impulse control disorders)

Data recorded on the CPRD were compared with the GP responses. On-off phenomena could not be defined using codes available on the CPRD, therefore identification of this outcome was made by GP response alone.

Findings

Responses were received for 41 questionnaires (response rate of 68%).

Confirmation of PD diagnosis: PD diagnosis was recorded correctly on the CPRD in 40 of the 41 responses. It was therefore deemed that data captured on the CPRD was sufficient and that further validation from the GP questionnaire would not be necessary for the main study.

Year of PD diagnosis: The year of PD diagnosis matched in 28 of the 40 responses. Of the remaining 12 responses, the GP response was always earlier than the CPRD date. Based on these results, and following a review of patient medical records, an algorithm was defined. By using the earliest of the PD diagnosis code, dopaminergic therapy or PD symptomatology allows estimation of PD diagnosis date to within 4 months in approximately 90% of cases compared to using date of PD READ coding date alone. It is proposed to use this algorithm to derive PD diagnosis date (and hence PD duration) using data captured within the CPRD. Supplementary information from GP questionnaire are not required.

Motor fluctuations prior to index date: This question aimed help classify patients into PD disease stage (early vs. advanced) at index date. The response to this question was reported as not known in 35% of GP responses, yes in 37.5% and no in 27.5%. It is proposed to retain this question in the GP questionnaire however if there are significant numbers of responses that are not known in the main study, this variable may be omitted.

Medication use: Medication use was well captured on the CPRD. Supplementary information from GP questionnaire will not be required in the main study.

Outcomes:

[1] Individuals with end of dose wearing off were indentified on the CPRD based on evidence of clinical manifestations of wearing off (READ codes for motor fluctuations, or evaluation of prescriptions suggesting increasing dose of levodopa /carbidopa, addition of a dopamine agonist, COMT inhibitor, apomorphine or MAO-B inhibitor, or deep brain stimulation) amongst individuals with PD that were treated with levodopa . In the GP questionnaire, the GP was required to tick a box to indicate the presence or absence of end of dose wearing off, together with a date of onset.

Dyskinesia:

Of the 12 cases that were identified as having probable dyskinesia on the CPRD, 7 were also confirmed by the GP questionnaire, 3 GPs responded no to the question and 2 did not know. 3 of the 9 cases that were identified as possible dyskinesia on the CPRD were also confirmed by the GP. 4 cases of dyskinesia were reported by the GP that were not identified using data from the CPRD. Data from the CPRD alone cannot be used to identify all dyskinesia cases. It is proposed that dyskinesia be identified based on data captured from the CPRD and from GP questionnaire. Individuals with dyskinesia reported from the GP questionnaire or with probable dyskinesia (defined using CPRD codes) will be used to identify individuals with dyskinesia. A clinical review of patient records with possible dyskinesia will be conducted to determine whether additional cases of dyskinesia exist.

Proportion of waking day with dyskinesia:

In the pilot study, we requested that GPs provided an estimate of the proportion of the waking day with dyskinesias. This information was poorly completed, and it is therefore proposed to omit this from the questionnaire for the main study.

End of dose wearing off:

Of the 9 patients identified on the CPRD as having end of dose wearing off , 1 of the GPs agreed but had the diagnosis 13 months earlier. 2 the GPs responded Not known and 6 stated No.

The GP identified 3 patients with end of off dose wearing off that had not been identified on the GPRD

Due to the inconsistency between the two sources of data, it is proposed to omit this outcome from the main study. Data captured within the CPRD are insufficient to define end of dose wearing off using READ, CPRD medical codes, or prescription data based on findings from the pilot study. There are concerns about the reliability and validity of this outcome if obtained from GP questionnaire alone, it is therefore proposed to omit this outcome from the main study.

On-off phenomena:

On-off phenomena was identified from the GP questionnaire alone since no relevant CPRD codes exist. Three patients were reported as having on-off phenomena from GP questionnaire. Since the accuracy and validity of this outcome is not known, all analyses evaluating this outcome must be interpreted with caution. In addition, should GP response rates substantially differ between exposure groups in the main study, then consideration to omit this outcome from the main study should be given.

Proportion of waking day off:

Although requested, no responses to the question "what proportion of the waking day is off" were received. It is therefore proposed to omit this question from the GP questionnaire.

Sudden onset of sleep (SOS):

Results from the CPRD and GP questionnaire were conflicting. Of the five individuals identified with READ codes suggestive of SOS (codes included narcolepsy, cataplexy, hypersomnia/excessive sleepiness and drowsiness) on the CPRD, only one was confirmed by the GP questionnaire. A code for hypersomnia was recorded in the GP record for the patient which was identified as possibly having SOS. The remaining four were reported not to have sudden onset of sleep from the GP questionnaire.

In total, four individuals were reported to have SOS based on GP questionnaire responses (including the one patient that was identified using READ codes). None of the GPs reported date of onset of SOS. It is therefore proposed to omit this outcome from the study due to concerns about the reliability or validity of the outcome.

Impulse control disorders:

It is proposed to retain this question in the GP questionnaire.

Pathological gambling: All three of the individuals identified as having pathological gambling on the CPRD were confirmed on the GP questionnaire.

Hypersexuality: No cases were identified on the CPRD, however three were identified by GP questionnaire.

Compulsive shopping, eating or other compulsive disorders: No cases were identified on the CPRD or by GP questionnaire.

Summary

It is not feasible to reliably identify patients with sudden onset of sleep or end of dose wearing off using data captured on the CPRD or by GP questionnaire. It is proposed to include questions on dyskinesias, on-off phenomena and impulse control disorders on the GP questionnaire for the main study. An evaluation of the GP questionnaire response rate between exposure groups must be taken into consideration prior to analysis of data.

Carbidopa monohydrate/Levodopa	Co-careldopa 50mg/200mg modified-release tablets (A A H Pharmaceuticals	Modified-relea
Carbidopa/levodopa	Co-careldopa 5mg/20mg/1ml intestinal gel 100ml cassette	Intestinal Gel
Carbidopa monohydrate/Levodopa	Co-careldopa 6.25mg/25mg/5ml oral suspension	Oral suspensi
Carbidopa/levodopa	Duodopa intestinal gel 100ml cassette (AbbVie Ltd)	Intestinal Gel
Carbidopa monohydrate/Levodopa	Half Sinemet CR 25mg/100mg tablets (Doncaster Pharmaceuticals Ltd)	Modified-relea
Carbidopa monohydrate/Levodopa	Half Sinemet CR 25mg/100mg tablets (Merck Sharp & Dohme Ltd)	Modified-relea
Carbidopa monohydrate/Levodopa	Half sinemet cr 25mg+100mg Tablet (Bristol-Myers Squibb Pharmaceuticals	Modified-relea
Carbidopa monohydrate/Levodopa	Lecado 25mg+100mg Modified-release tablet (Sandoz Ltd)	Modified-relea
Carbidopa monohydrate/Levodopa	Lecado 50mg+200mg Modified-release tablet (Sandoz Ltd)	Modified-relea
Carbidopa/levodopa	LEVODOPA 100mg/10mg CARBIDOPA	
Carbidopa/levodopa	LEVODOPA 100mg/25mg CARBIDOPA	
Carbidopa/levodopa	LEVODOPA 250mg/25mg CARBIDOPA	
Carbidopa	Levodopa with carbidopa 100mg + 10mg Tablet	Tablet
Carbidopa	Levodopa with carbidopa 100mg + 25mg Modified-release tablet	Modified-relea
Carbidopa	Levodopa with carbidopa 100mg + 25mg Tablet	Tablet
Carbidopa	Levodopa with carbidopa 200mg + 50mg Modified-release tablet	Modified-relea
Carbidopa	Levodopa with carbidopa 250mg + 25mg Tablet	Tablet
Carbidopa	Levodopa with carbidopa 50mg + 12.5mg Tablet	Tablet
Carbidopa monohydrate/Levodopa	Sinemet 10mg/100mg tablets (Lexon (UK) Ltd)	Tablet
Carbidopa monohydrate/Levodopa	Sinemet 10mg/100mg tablets (Merck Sharp & Dohme Ltd)	Tablet
Carbidopa monohydrate/Levodopa	Sinemet 10mg/100mg tablets (Sigma Pharmaceuticals Plc)	Tablet
Carbidopa monohydrate/Levodopa	Sinemet 110 Tablet (Bristol-Myers Squibb Pharmaceuticals Ltd)	Tablet
Carbidopa monohydrate/Levodopa	Sinemet 12.5mg/50mg tablets (Merck Sharp & Dohme Ltd)	Tablet
Levodopa/Carbidopa monohydrate	Sinemet 25mg/250mg tablets (Dowelhurst Ltd)	Tablet
Levodopa/Carbidopa monohydrate	Sinemet 25mg/250mg tablets (Mawdsley-Brooks & Company Ltd)	Tablet
Levodopa/Carbidopa monohydrate	Sinemet 25mg/250mg tablets (Merck Sharp & Dohme Ltd)	Tablet
Levodopa/Carbidopa monohydrate	Sinemet 275 Tablet (Bristol-Myers Squibb Pharmaceuticals Ltd)	Tablet
Carbidopa monohydrate/Levodopa	Sinemet 62.5 Tablet (Bristol-Myers Squibb Pharmaceuticals Ltd)	Tablet
Carbidopa monohydrate/Levodopa	Sinemet CR 50mg/200mg tablets (Merck Sharp & Dohme Ltd)	Modified-relea
Carbidopa monohydrate/Levodopa	Sinemet CR 50mg+200mg Tablet (Bristol-Myers Squibb Pharmaceuticals Ltd	Modified-relea
Carbidopa monohydrate/Levodopa	Sinemet Plus 25mg/100mg tablets (Doncaster Pharmaceuticals Ltd)	Tablet
Carbidopa monohydrate/Levodopa	Sinemet Plus 25mg/100mg tablets (Merck Sharp & Dohme Ltd)	Tablet
Carbidopa monohydrate/Levodopa	Sinemet Plus 25mg/100mg tablets (Waymade Healthcare Plc)	Tablet
Carbidopa monohydrate/Levodopa	Sinemet plus Tablet (Bristol-Myers Squibb Pharmaceuticals Ltd)	Tablet
Carbidopa monohydrate/Levodopa	Tilolec 200mg/50mg modified-release tablets (Tillomed Laboratories Ltd)	Modified-relea
Carbidopa	Levodopa with carbidopa and entacapone 100mg + 25mg + 200mg Tablet	Tablet
Carbidopa	Levodopa with carbidopa and entacapone 125mg + 31.25mg + 200mg Table	Tablet
Carbidopa	Levodopa with carbidopa and entacapone 150mg + 37.5mg + 200mg Tablet	Tablet
Carbidopa	Levodopa with carbidopa and entacapone 200mg + 50mg + 200mg Tablet	Tablet
Carbidopa	Levodopa with carbidopa and entacapone 50mg + 12.5mg + 200mg Tablet	Tablet
Carbidopa	Levodopa with carbidopa and entacapone 75mg + 18.75mg + 200mg Tablet	Tablet
Levodopa/Carbidopa/Entacapone	Stalevo 100mg/25mg/200mg tablets (Lexon (UK) Ltd)	Tablet
Levodopa/Carbidopa/Entacapone	Stalevo 100mg/25mg/200mg tablets (Orion Pharma (UK) Ltd)	Tablet
Carbidopa/levodopa/entacapone	Stalevo 125mg/31.25mg/200mg tablets (Orion Pharma (UK) Ltd)	Film Coated T

Entacapone/Carbidopa/Levodopa	Stalevo 150mg/37.5mg/200mg tablets (Orion Pharma (UK) Ltd)	Tablet
