

NON-INTERVENTIONAL SECONDARY DATA ANALYSIS STUDY PROTOCOL

Study Title	Multicenter, Non-Interventional, Retrospective, Matched Cohort Study of Patients Monoinfected with Chronic Hepatitis B and with Moderate or Severe Renal Impairment Treated with Viread [®] or Baraclude [®]
Protocol ID	GS-EU-174-1846
Protocol Version/Date:	Version 1.2: 18 March 2016
EU PAS Register No	ENCEPP/SDPP/12897
Clinical Trials.gov Identifier Active substances	Study not registered (non-interventional) Tenofovir disoproxil fumarate ATC Code: J05AF Nucleoside and nucleotide reverse transcriptase inhibitors Entecavir (as monohydrate) ATC Code: J05AF Nucleoside and nucleotide reverse transcriptase inhibitors
Medicinal Products	Tenofovir Disoproxil (as Fumarate) [Viread [®]] Entecavir (monohydrate) [Baraclude [®]]
Product references	For Viread [®] EU/1/01/200/001 EU/1/01/200/002 EU/1/01/200/003
	For Baraclude [®] EU/1/06/343/001 EU/1/06/343/002 EU/1/06/343/003 EU/1/06/343/004 EU/1/06/343/005 EU/1/06/343/006 EU/1/06/343/007
Procedure number	Not applicable
Joint PASS	No

Research question and objectives	 The primary of Retrogrammer amony severe special 	objective of this study is to: spectively evaluate the safety of Viread [®] g chronic hepatitis B patients with moderate or e renal impairment, focusing on renal events of l interest.
	 The secondar Descriteration Treation model Compand B arms. 	y objectives of this study are to: ibe the effectiveness of Viread [®] in the nent of chronic hepatitis B in patients with rate or severe renal impairment. are safety and effectiveness between Viread [®] araclude [®] among the matched study cohort
Countries of study	Up to 50 cent Italy and Spa	ers in the United Kingdom, Germany, France, in.
Gilead Study Director / Author/ Contact Person:	Name: Telephone:	Heribert Ramroth +44 (0) 208 587 2560
Marketing Authorization Holder	For Viread [®] Gilead Sciend Flowers Built Cambridge, C United Kingo	ces International Ltd. ding, Granta Park CB21 6GT lom

Title:	Multicenter, Non-Interventional, Retrospective, Matched Cohort Study of Patients Monoinfected with Chronic Hepatitis B and with Moderate or Severe Renal Impairment Treated with Viread [®] or Baraclude [®]
Rationale and Background:	This non-interventional study is designed to evaluate the safety and effectiveness of either Viread [®] or Baraclude [®] in chronic hepatitis B (CHB) patients with moderate or severe renal impairment.
Research Question and	The primary objective of this study is:
Objectives:	• To retrospectively evaluate the safety of Viread [®] among chronic hepatitis B patients with moderate or severe renal impairment, focusing on renal events of special interest.
	The secondary objectives of this study are:
	• To describe the effectiveness of Viread [®] in the treatment of chronic hepatitis B in patients with moderate or severe renal impairment.
	• To compare safety and effectiveness between Viread [®] and Baraclude [®] among the matched study cohort arms.
Study Design:	Multicenter, non-interventional, retrospective, matched cohort study.
Population	Cohort definition: Adult CHB monoinfected patients who had experienced at least one occurrence of moderate or severe renal impairment with creatinine clearance (CrCL) 20-60 mL/min (by Cockcroft-Gault formula), while concomitantly treated with either Viread [®] or Baraclude [®] (monotherapy) at any time between 23 rd April 2008 (Centralized European marketing authorization approval date for Viread [®] tablets in HBV indication) and 31 st December 2015.
	Each patient's data will be collected from the first recorded date on which their CrCL was documented to be between 20-60 mL/min, while treated with Viread [®] or Baraclude [®] .

	When either Viread [®] or Baraclude [®] therapy was terminated or replaced by another HBV therapy, documentation of available routine visit data will stop 12 weeks after Viread [®] or Baraclude [®] therapy termination or at the time of replacement therapy initiation or 31 st December 2015, whichever occurred first. In case of discontinuation of Viread [®] or Baraclude [®] for reasons of decreasing renal function, the post-treatment observation period will capture renal laboratory parameters (i.e. creatinine clearance, phosphate, as per safety laboratory variables) and any new medications with the potential for renal toxicity for up to 6 months or until 31 st December 2015, whichever occurred first.
	Each participating center will also be asked to separately report the total number of adult CHB (monoinfected) patients who have been prescribed either Viread [®] or Baraclude [®] for HBV, at any time between 23 rd April 2008 and 31 st December 2015.
Variables:	This is a non-interventional study, only data available from routine medical care will be collected within the study.
	Identical variables will be collected in both cohort arms, i.e. the Viread [®] cohort and the Baraclude [®] cohort.
	When available, the following parameters will be de-identified and collected from patients' medical records:
	Patient characteristics:
	- Age group, gender, height, weight
	• HBV disease characteristics:
	— Estimated date of CHB diagnosis
	— Hepatitis B e antigen (HBeAg) status (negative or positive)
	— Cirrhosis (present or absent)
	• HBV treatment:
	— Prior HBV treatment history (type and duration)
	— Initiation date of either Viread [®] or Baraclude [®] treatment
	 — Viread[®]/Baraclude[®] dosage form and dosing schedule (dose and frequency)
	 — Changes in Viread[®]/Baraclude[®] dosage form and dosing schedule (dose and frequency)
	— Viread [®] /Baraclude [®] treatment interruptions or discontinuation dates including reasons for interruptions or discontinuation

- Renal impairment status: The information on whether the current renal impairment episode with CrCL between 20-60-mL/min was present before or after the initiation of Viread[®]/Baraclude[®] treatment will be collected at the start of the observation period.
- Relevant medication use (i.e. potentially nephrotoxic drugs and non-steroidal anti-inflammatory drugs [NSAIDs]) and presence of certain comorbidities (i.e. hypertension, diabetes and hyperlipidemia) which, in the investigator's opinion, could have adversely impacted renal function or could have contributed to renal insufficiency.

Safety variables

- Safety events:
 - Renal adverse events (AEs) or renal serious adverse events (SAEs)
 - Fatal adverse events
 - Adverse drug reactions (ADRs) related to either Viread[®] or Baraclude[®]
 - Special Situation Reports (SSRs)
- Laboratory evaluations:
 - Renal tests:
 - Creatinine clearance (CrCL), as given according to the Cockcroft-Gault formula¹
 - Serum phosphate
 - Liver tests (to be collected at the start of the observation period only):
 - Alanine aminotransferase (ALT)
 - Aspartate aminotransferase (AST)
 - International Normalized Ratio (INR)
 - Platelet count
 - Serum bilirubin
 - Serum albumin

¹ Creatinine clearance will be calculated by the investigative centers based on Cockcroft-Gault formula.

CrCL (mL/min) = [(140 - age in years) * (weight in kg) * (0.85 if female)] / [(72 * (serum creatinine in mg/dL)]

	Effectiveness variables
	• HBV disease characteristics:
	 — Serological response (i.e. loss of HBeAg and/or seroconversion to anti-HBe, loss of HBsAg and/or seroconversion to anti-HBs)
	— HBV DNA levels
	 Clinical evidence of disease progression (i.e. development of cirrhosis or decompensated liver disease)
Data Sources:	The primary data source will be the patient medical record. All data will be de-identified and collected for those patients meeting all eligibility criteria by means of electronic Case Report Forms (eCRF), including a unique subject identifier for each patient by each participating center.
Study Size:	Up to 50 centers in the United Kingdom, Germany, France, Italy and Spain, countries wherein Viread [®] oral granule and/or tablet formulations have been the most widely used in CHB patients.
	Based on the limited numbers from previous studies, it is estimated that data from less than 100 patients treated with Viread [®] may be available for this study. Data from approximately the same number of patients treated with Baraclude [®] will be collected for a comparator arm, resulting in a total of up to 200 patients for a retrospectively matched cohort study.
Data Analysis	Data will be summarized using univariate descriptive statistics. Continuous variables will be summarized by mean, standard deviation, median, lower quartile, upper quartile, minimum and maximum. Categorical variables will be summarized by number and percentage of patients in each categorical definition including according 95% confidence intervals.
	Multivariate analyses will be used to estimate adjusted rates and proportions. In order to maximize homogeneity between the two cohorts and reduce the impact of treatment-selection bias a retrospective propensity score matching (PSM) approach will be applied. Conditional multivariate logistic or linear regression models will be used to assess differences between the two study cohorts.

Milestones:	Start of data collection: Q2 2016
	End of Data collection: Q1 2017
	Progress report: Q4 2016
	Final Study report: Q3 2017

This study will be conducted in accordance with the guidelines of Good Pharmacoepidemiology Practices (GPPs) and Heads of Medicines Agencies (HMA) Good Pharmacovigilance Practices (GVP) including archiving of essential documents.

5. AMENDMENTS AND UPDATES

Amendment or Update Number	Date	Section of Study Protocol	Amendment or Update	Reason
Update #1	12 January 2016	Sections 6, 7.1, 8, 9.2, 9.3, 9.5, 9.7, 10.3, 11.4, 11.5, 12.1	Update	Changes to address comments received from the Pharmacovigilance Risk Assessment Committee (PRAC) of the European Medicines Agency.
Update #2	18 March 2016	Sections 6, 7.1, 8, 9.1, 9.2, 9.3, 9.5, 9.7, 9.9, 11	Update	Changes to address comments received from the PRAC; addition of a control arm with entecavir.

• Protocol Modifications

Protocol modifications may be made only by Gilead Sciences Europe Ltd. Approval must be obtained before changes can be implemented.

6. MILESTONES

Milestone	Planned Date
Registration in the EU PASS register	Prior to start of data collection
Start of data collection	Q2 2016
End of data collection	Q1 2017
Progress report	Q4 2016
Final report of study results	Q3 2017

7. RATIONALE AND BACKGROUND

7.1. Rationale for the Current Study

Tenofovir disoproxil fumarate (TDF; Viread[®]) is an antiviral prodrug of tenofovir (TFV). Following absorption, TDF is rapidly and completely converted to TFV, a nucleoside monophosphate (nucleotide) analogue. Within the cell, TFV is converted to its active form, tenofovir diphosphate, which inhibits the activity of hepatitis B virus (HBV) reverse transcriptase by competing with the natural substrate deoxyadenosine 5' triphosphate, leading to deoxyribonucleic acid (DNA) chain termination.

TDF has activity against HBV, and is indicated for treatment of chronic HBV infection in adults and adolescents 12 to <18 years of age.

TFV is primarily excreted by the kidney by both filtration and an active tubular transport system with approximately 70 to 80% of the dose excreted unchanged in urine following intravenous administration. TDF is an oral prodrug that is never given intravenously. The proof of concept study (Study 701) for TFV in HIV used an intravenous form of TFV {Deeks et al 1998}.

TDF, as Viread[®] 245 mg tablets, was approved for the treatment of CHB in adults within the European Union (EU) on 23rd April 2008.

Viread[®] 33 mg/g oral granules were approved on 22nd November 2012 by the EU Committee for Medicinal Products for Human Use (CHMP).

This study uses a cohort of patients treated with entecavir as a comparator to the Viread[®]-treated cohort. Entecavir serves solely for the purposes of comparison in this study. Entecavir (ETV; Baraclude®), a guanosine nucleoside analogue with activity against HBV polymerase, is efficiently phosphorylated to the active triphosphate (TP) form. Entecavir-TP functionally inhibits HBV reverse transcriptase, by competing with the natural substrate deoxyguanosine TP {Bristol-Myers Squibb Pharmaceutical Limited 2014}.

ETV, as Baraclude[®] 0.5 mg and 1 mg tablets and oral solution (0.05mg/mL), was approved for the treatment of CHB in adults within the European Union (EU) on 26th June 2006. The Marketing Authorisation Holder is Bristol-Myers Squibb Pharma EEIG (BMS).

The clearance of entecavir decreases with decreasing creatinine clearance. Dose adjustment is recommended for patients with creatinine clearance < 50 ml/min, including those with end-stage renal disease maintained on haemodialysis or continuous ambulatory peritoneal dialysis (CAPD). A reduction of the daily dose using Baraclude® oral solution is recommended. As an alternative, in case the oral solution is not available, the dose can be adjusted by increasing the dosage interval. The proposed dose modifications are based on extrapolation of limited data, and their safety and effectiveness have not been clinically evaluated. Therefore, virological response should be closely monitored. {Pipili et al 2013}

There are limited data on the safety and efficacy of TDF in adult patients with moderate and severe renal impairment. Therefore, in adult patients with renal impairment TDF should only be used if the potential benefits of treatment are considered to outweigh the potential risks {Pipili et al 2013}. Adjustments of the daily dose of TDF 33 mg/g granules are recommended in patients with moderate or severe renal impairment based on modelling of single-dose pharmacokinetic data in HIV negative and non-HBV infected subjects with varying degrees of renal impairment. These pharmacokinetic modelling data have not been confirmed in clinical studies. Therefore, clinical response to treatment and renal function should be closely monitored in these patients.

Given that the recommended dose adjustments are not based on clinical responses, there is a need to evaluate the safety and efficacy of Viread[®] in HBV patients with moderate or severe renal impairment.

With regards to safety and efficacy data from ongoing or previously completed studies with TDF in chronic HBV patients with moderate to severe renal impairment, Gilead has identified only 37 patients in Gilead-sponsored HBV trials with a creatinine clearance between 20 to 60 mL/min by the Cockcroft-Gault method on at least one occasion (GX-DE-174-0129 and GX-FR-174-0130).

Given the limited nature of existing data, this non-interventional study is being undertaken to collect real-world data on the use of Viread[®] in patients with moderate or severe renal impairment in a retrospective fashion. These data are intended to gain a better understanding of the use, safety and effectiveness of Viread[®] in this special patient population.

8. **RESEARCH QUESTIONS AND OBJECTIVES**

The primary objective of this study is

• To retrospectively evaluate the safety of Viread[®] among adult chronic hepatitis B patients with moderate or severe renal impairment, focusing on renal events of special interest.

The secondary objectives of this study are:

- To describe the effectiveness of Viread[®] in the treatment of chronic hepatitis B patients with moderate or severe renal impairment.
- To compare safety and effectiveness between Viread[®] and Baraclude[®] among the matched study cohort arms.

9. **RESEARCH METHODS**

9.1. Study Design

This is a multicenter, non-interventional, retrospective, matched cohort study.

Safety and efficacy data will be de-identified and retrospectively collected from medical records for those patients who meeting all eligibility criteria.

9.2. Setting

Data will be retrospectively collected from medical records of patients meeting <u>all</u> of the following eligibility criteria:

Inclusion Criteria

- 1) Male or female patients older than 18 years (inclusive).
- 2) Chronic hepatitis B patients.
- 3) Patients who had been treated with Viread[®] (monotherapy), administered either as oral granules once daily and/or as a tablet formulation once daily or in prolonged dosing intervals,

or patients who had been treated with $Baraclude^{(R)}$ (monotherapy) as a tablet formulation once daily and/or as oral solution.

- 4) Patients treated with Viread[®] or Baraclude[®] at any time between 23rd April 2008 (Centralized European marketing authorization approval date for Viread[®] tablets in HBV indication) and 31st December 2015.
- 5) Patients who had experienced at least one occurrence of moderate or severe renal impairment with CrCL between 20-60 mL/min inclusive (based on Cockcroft-Gault formula), while treated with Viread[®] or Baraclude[®].

Exclusion Criteria

- 1) Patients with human immunodeficiency virus (HIV), hepatitis C virus (HCV), or hepatitis D virus (HDV) co-infection.
- 2) Patients who had been prescribed treatment with Viread[®] and Baraclude[®] in combination with each other when the CrCL of 20-60 mL/min occurred.
- 3) Patients who had been prescribed treatment with either Viread[®] or Baraclude[®] in combination with other HBV therapies when the CrCL of 20-60 mL/min occurred.

In case a given patient had been treated by both Viread[®] and Baraclude[®], and experienced at least one occurrence of moderate to severe renal impairment while treated by both Baraclude[®] and

Viread[®], this patient will be included in the treatment cohort corresponding to the treatment they were on during the first occurrence of moderate to severe renal impairment.

Each patient's data will be de-identified and collected from the first recorded date on which their CrCL was documented to be between 20-60 mL/min, while on study treatment (either Viread[®] or Baraclude[®]).

When study treatment (Viread[®] or Baraclude[®]) was terminated or replaced by other HBV medications, documentation of available routine visit data will stop 12 weeks after therapy termination or at the time of replacement therapy initiation or 31st December 2015, whichever occurred first. In case of discontinuation of Viread[®] or Baraclude[®] therapy for reasons of decreasing renal function, the post-treatment observation period will capture renal laboratory parameters (i.e. creatinine clearance and phosphate, as per safety laboratory variables) and any new medications with the potential for renal toxicity for up to 6 months or until 31st December 2015, whichever occurred first.

Each participating center will also be asked to separately report the total number of adult CHB (monoinfected) patients who have been prescribed either Viread[®] or Baraclude[®] for HBV, at any time between 23rd April 2008 and 31st December 2015.

9.3. Variables

This is a non-interventional evaluation, only data available from routine medical care will be collected within this study.

Identical variables will be collected in both cohort arms, i.e. the Viread[®] cohort and the Baraclude[®] cohort.

When available, the following parameters will be de-identified and collected from patients' medical records:

- Patient characteristics:
 - Age group, gender, height, weight
- HBV disease characteristics:
 - Estimated date of CHB diagnosis
 - Hepatitis B e antigen (HBeAg) status (negative or positive)
 - Cirrhosis (present or absent)
- HBV treatment:
 - Prior HBV treatment history, if applicable (type and treatment duration)
 - Initiation date of either $Viread^{\mathbb{R}}$ or $Baraclude^{\mathbb{R}}$ treatment

- Viread[®]/Baraclude[®] dosage form and dosing schedule (dose and frequency)
- Changes in Viread[®]/Baraclude[®] dosage form and dosing schedule (dose and frequency)
- Viread[®]/Baraclude[®] treatment interruptions or discontinuation dates, including reasons for interruptions or discontinuation
- Renal impairment status: The information on whether the current renal impairment episode with CrCL between 20-60 mL/min was present before or after the initiation of Viread[®]/Baraclude[®] treatment will be collected at the start of the observation period.
- Relevant medication use (i.e. potentially nephrotoxic drugs and non-steroidal anti-inflammatory drugs [NSAIDs]) and presence of certain comorbidities (i.e. hypertension, diabetes and hyperlipidemia) which, in the investigator's opinion, could have an adversely impacted renal function or could have contributed to renal insufficiency.

Safety variables

- Safety events:
 - Renal adverse events (AEs) or renal serious adverse events (SAEs)
 - Fatal adverse events
 - Adverse drug reactions (ADRs) related to either Viread[®] or Baraclude[®]
 - Special Situation Reports (SSRs)
- Laboratory evaluations:
 - Renal tests:
 - Creatinine clearance (CrCL), as given according to the Cockcroft-Gault formula²
 - Serum phosphate
 - Liver tests (to be collected at the start of the observation period only):
 - Alanine aminotransferase (ALT)
 - Aspartate aminotransferase (AST)
 - International Normalized Ratio (INR)
 - Platelet count

² Creatinine clearance will be calculated by investigator based on Cockcroft-Gault formula.

CrCL (mL/min) = [(140 - age in years) * (weight in kg) * (0.85 if female)] / [(72 * (serum creatinine in mg/dL)]

- Serum bilirubin
- Serum albumin

Effectiveness variables

- HBV disease characteristics:
 - Serological response (i.e. loss of HBeAg and/or seroconversion to anti-HBe, loss of HBsAg and/or seroconversion to anti-HBs)
 - HBV DNA level
 - Clinical evidence of disease progression (i.e. development of cirrhosis or decompensated liver disease)

9.4. Data Sources

The primary data source will be the patient medical record. All data will be de-identified and retrospectively collected for those patients meeting all eligibility criteria by means of electronic Case Report Forms (eCRF) with a unique subject identifier for each patient, by each participating center.

9.5. Study Size

Data will be collected on all patients meeting eligibility criteria from up to 50 centers in the United Kingdom, Germany, France, Italy and Spain, namely countries wherein Viread[®] oral granule and/or tablet formulations have been the most widely used in CHB patients.

Previous Viread[®] studies in Germany and France identified only very few HBV patients with moderate or severe renal impairment. The German study (GX-DE-174-0129) including 400 patients across 33 centers identified 7 patients with moderate and 2 patients with severe renal impairment enrolled in a period of 12 months. The respective numbers for the French study (GX-FR-174-0130) were 27 patients (moderate) and 1 patient (severe) out of 440 patients over the same time period across 58 study centers.

Based on the limited numbers from these previous studies, it is estimated that data from less than 100 patients treated by Viread[®] may be available for this study. Data from approximately the same number of patients treated by Baraclude[®] will be collected for a comparator arm, resulting in a total of up to 200 patients for a retrospectively matched cohort study.

As there are expected to be very low number of such patients treated with Viread[®] and consequently possible challenges to identify properly matching Baraclude[®] treated patients, the overall objective of the study remains focused on the Viread[®] treated cohort. However, we will make efforts to enroll a cohort of Baraclude[®] treated patients that are approximately matching the Viread[®] treated patients and aim to include similar numbers in both. The Baraclude[®] arm will

serve as a reference point for the Viread[®] cohort and exploratory comparative analyses will be conducted to support the secondary objective of the study.

Cumulative open label data through year 8 in two prospective Viread[®] studies (GS-US-174-0102 and GS-US-174-0103) revealed an incidence of renal events leading to dose reduction, treatment interruption, or discontinuation during the open label period of 3.4% {Gilead Sciences Inc 2015, Marcellin et al 2014}. A study that compared Viread[®] and Baraclude[®] showed similar risks of renal events among patients treated with tenofovir or entecavir for chronic hepatitis B although higher risks in the Viread[®] arm were anticipated {Gish et al 2012}.

A sample size of 100 subjects will provide greater than 80% power to detect a difference in the incidence of renal events (effect size) of 6.0% when the expected rate is 3.4%.

9.6. Data Management

The study will use an electronic case report form (eCRF) and all users will receive specific access codes to enable them to enter their data. The eCRF will contain automatic checks for data completeness and to identify inconsistent data. Participating centers will enter available data from patient's medical records into the eCRF.

9.7. Data Analysis

Data from this non-interventional study will be summarized using univariate descriptive statistical methods. Continuous variables will be summarized descriptively (mean, standard deviation, and median, lower quartile, upper quartile, minimum, maximum, 95% confidence intervals). All categorical variables will be summarized by number and percentage of patients in each categorical definition and including 95% confidence intervals. Counts for missing values will be also tabulated but missing values will not be considered in the percentages.

Multivariate analyses will be used to model the odds for a given event (logistic regression models) adjusted for potential confounders. Conditional multivariate regression models will be used to show differences between the two study cohorts. Post data collection Propensity Score Matching (PSM) will be used to adjust for potential confounding, using patient characteristics, HBV disease and treatment characteristics, renal impairment status, relevant medication use and presence of certain comorbidities to create the propensity score.

The PSM approach will be applied in order to maximize homogeneity between cohorts and reduce the impact of treatment-selection bias. The propensity score is defined as a patient's probability of receiving a specific treatment (Viread[®]) conditional on the observed covariates {Rosenbaum et al 1983}. When propensity scores are used in matching, treatment effects are unbiased under the condition that treatment assignment is strongly ignorable {D'Agostino 1998}. On the other hand, treatment assignment is strongly ignorable if treatment cohorts and the outcome variable are conditionally independent given the covariates. This independence assumption will not hold in situations where there are variables not included as propensity score covariates that are correlated with outcome events and time dependent treatment selection {Johnson et al 2009}.

Details will be described in the Statistical Analysis Plan (SAP).

The PSM procedure will include the following steps:

- 1) Model choice: The propensity score will be computed using binary regression with a logit or a probit link function, depending on model fitting statistics. Statistical based criteria will be used to specify the covariates, such as the degree of association with Viread[®] odds.
- 2) Matching algorithm choice: The nearest neighbor algorithm or the nearest neighbor within a specified caliper distance algorithm will be used as a matching algorithm. The nearest neighbor matching selects for variable matching to a given Viread[®] patient the Baraclude[®] patient whose propensity score is closest to that of the Viread[®] patient. Nearest neighbor matching within a specified caliper distance is similar to nearest neighbor matching with the further restriction that the absolute difference in the propensity scores of matched patients must be below some pre-specified threshold (the caliper distance) {Austin 2011b}, {Austin 2011a}.
- 3) Matching: Assign the matching membership and retain the propensity score for the case where further adjustment is needed.

Missing data will not be imputed.

The following sub-groups will be considered within each study cohort for modeling:

- Patients receiving once daily reduced-dose Viread[®] using oral granule formulation or extended interval dosing using Viread[®] tablets
- Patients receiving once daily reduced-dose Baraclude[®] using oral solution or extended interval dosing using the Baraclude[®] 0.5 mg or 1 mg tablet
- Patients with renal impairment (20-60 mL/min by Cockcroft-Gault formula) before either Viread[®] or Baraclude[®] treatment initiation
- Patients with renal AE during either treatment (Viread[®]/Baraclude[®])

Safety will be estimated determining rates of AEs and summarising laboratory test results. The proportion of patients with tolerability failure (defined as an AE leading to permanent discontinuation of study drug), renal AEs, renal AEs of special interest and clinical laboratory tests will be collected and summarized through the first year and annually thereafter.

Effectiveness will be estimated determining the proportion of subjects with HBV DNA below 400 copies/mL (69 IU/mL) in week 48, 96, 144, etc.

Renal events of special interest are defined as:

- Presence of proximal tubulopathy (PRT)
- Renal AEs leading to withdrawal of either Viread[®] or Baraclude[®] treatment

- Renal AEs leading to dialysis
- Renal SAEs including deaths
- Decline in renal function if reported as an AE

The primary parameter for assessing effectiveness will be virologic response through serial monitoring of HBV DNA levels, which is a standard of care for patient with CHB. For purposes of this retrospective study, response to therapy will be defined as achievement and/or maintenance of HBV DNA <2000 IU/mL. While the goal of therapy for HBV patients is to achieve complete undetectability of HBV DNA, the study will involve HBV DNA assessments obtained retrospectively from multiple local clinical laboratories: therefore, a more conservative definition will be applied. Achievement of an HBV DNA level below 2000 IU/mL is considered the viral level of suppression that is indicative of a therapeutic response (EASL Guidelines) {European Association for the Study of the Liver (EASL) 2012}, {Terrault et al 2015}. A signal for loss of effectiveness would therefore be any subject who initiates treatment with TDF and fails to achieve HBV DNA <2000 IU/mL after 48 weeks (primary nonresponse), or any subject who achieves virologic breakthrough, defined as achieving HBV DNA < 2000 IU/mL with subsequent development of viremia above 2000 IU/mL while on TDF/ETV treatment, or any subject who experiences $a \ge 1.0 \log 10 \text{ IU/mL}$ increase from nadir who has not yet achieved HBV DNA <2000 IU/mL. Due to the observational nature of this study, a window of ± 2 months around 12 months is acceptable. Virologic breakthroughs must be confirmed by two consecutive HBV DNA measurements.

AEs will be coded using the Medical Dictionary for Regulatory Activities (MedDRA). System Organ Class (SOC), High-Level Group Term (HLGT), High-Level Term (HLT), Preferred Term (PT), and Lower-Level Term (LLT) will be attached to the database.

Details will be described in the SAP.

All statistical analyses will be conducted using SAS[®] software (SAS Institute, Cary, North Carolina, USA) or other standard software tools including Stata[®] (StataCorp LP, College Station, Texas, USA).

9.8. Quality Control

The electronic data entry system will contain automatic checks for data completeness and to identify inconsistent data and respective queries will be generated when necessary. Data and queries will be remotely monitored for consistency and completeness. Study monitors will not have access to patients' source data, in order to preserve the patients' anonymisation.

9.9. Limitations of the Research Methods

As documentation of study variables in a retrospective study is not obligatory missing data of unpredictable extent can occur.

Sites will be selected if in a given site's database there is at least one adult CHB monoinfected patient who experienced at least one occurrence of moderate or severe renal impairment with CrCL 20-60 mL/min (by Cockcroft-Gault formula), while concomitantly treated with either Viread[®] or Baraclude[®] (monotherapy). The time period during which a site must have treated at least one such patient is between 23rd April 2008 and 31st December 2015. A potential selection bias resulting from this procedure cannot be excluded.

Given the retrospective nature of this non-interventional study design, the fact that patients were managed by multiple physicians, and the likelihood that there is a preferred treatment option for patients with renal impairment (entecavir), it will be difficult to interpret the results of a comparator arm. Moreover, baseline demographics and disease characteristics may differ between groups (tenofovir treated patients may be expected to be older, with a longer treatment duration for hepatitis B, including prior failure to lamivudine therapy). Matching the groups might therefore result in a loss of patients, due to the exclusion of the non-matching patients.

9.10. Other Aspects

9.10.1. Joint Investigator/Sponsor Responsibilities

9.10.1.1. Access to Information for Monitoring

The study monitor is responsible for routine remote review of the CRFs at regular intervals throughout the study to verify the completeness and consistency of the data being entered on the forms. The study monitor will not have access to patients' source data.

The investigator agrees to cooperate with the study monitor to ensure that any problems detected in the course of these monitoring activities are resolved.

9.10.1.2. Study Discontinuation

Both the sponsor and the investigator reserve the right to terminate the study at any time. Should this be necessary, both parties will arrange discontinuation procedures and notify the appropriate regulatory agencies and independent ethics committees (IECs).

10. PROTECTION OF HUMAN SUBJECTS

10.1. Good Pharmacoepidemiology Practices and Pharmacovigilance Practices

The study will be conducted in accordance with the principles of the International Conference on Harmonization (ICH) Pharmacovigilance Planning E2E guidelines, and with the laws and regulations of the country in which the research is conducted.

The study will be conducted in accordance with the guidelines of Good Pharmacoepidemiology Practices (GPPs), Heads of Medicines Agencies (HMA) Good Pharmacovigilance Practices (GVP) including archiving of essential documents.

10.2. Independent Ethics Committee (IEC) Review

Each participating center will be responsible to adhere to their appropriate local ethics approval procedures for this retrospective, non-interventional cohort study (i.e. to contact their local ethics committee to determine whether additional protocol approval is required). Data collected from patients' medical records will be de-identified: patient identifiers will be removed to ensure patient confidentiality.

10.3. Informed Consent

No informed consent will be obtained unless specifically required by an appropriate ethics committee or required by country National Data Protection Laws, for a participating center. All data used in this study will be de-identified and retrospectively collected in an eCRF with a unique subject identifier for each patient by each participating center.

10.4. Confidentiality

The investigator and Gilead must assure that patients' anonymity will be strictly maintained and that their identities are protected from unauthorized parties. Only a unique identifier (as allowed by local law) and a unique study identification code should be recorded on any study-related document.

The investigator agrees that all information received from Gilead, including but not limited to this protocol, CRFs, and any other study information, remain the sole and exclusive property of Gilead during the conduct of the study and thereafter. This information is not to be disclosed to any third party (except employees or agents directly involved in the conduct of the study or as required by law) without prior written consent from Gilead. The investigator further agrees to take all reasonable precautions to prevent the disclosure by any employee or agent of the study site to any third party or otherwise into the public domain.

11. MANAGEMENT AND REPORTING OF ADVERSE EVENTS/ADVERSE REACTIONS

11.1. Investigator Instructions for Collecting and Reporting Selected Safety Information to Gilead

The following retrospective safety information is required to be collected and reported for this study

- All fatal events (regardless of causality)
- All serious and non-serious renal adverse events
- All renal events of special interest (i.e. renal SAEs, AEs of proximal renal tubulopathy [PRT], decline in renal function if reported as an AE and renal AEs leading to related to Viread[®] or Baraclude[®] discontinuation or dialysis)
- All serious adverse drug reactions (SADRs) (related to Viread[®] or Baraclude[®])
- All adverse drug reactions (ADRs) (related to Viread[®] or Baraclude[®])
- All special situation reports (SSRs) occurring during the observation period

Timelines for reporting to Gilead are as follows:

- Within 3 calendar days of knowledge of all fatal events (regardless of causality) and SADRs/SAEs
- Within 30 calendar days of knowledge of the AE/ADRs
- Within 30 calendar days of knowledge for SSRs

Details of the methods for reporting AEs, SAEs, and SSRs to Gilead DSPH will be described in the CRF completion guidelines. If reporting of events is by electronic submission via eCRF, this method must always be used unless the eCRF system is not functioning. If for any reason it is not possible to record events electronically, the details should be recorded on the appropriate paper reporting forms (the Non-Interventional Study AE/SAE Report Form) and submitted by fax or e-mail, within the timelines given above to:

Gilead DSPH contact information is as follows:

E-mail: Safety_FC@gilead.com

Fax:+1 (650) 522-5477

• As soon as it is possible to do so, any death, ADR, SADR, and SSR reported via paper must be transcribed into the eCRF database according to the instructions in the eCRF completion guidelines.

11.1.1. Instructions for Reporting Pregnancies

All pregnancies that occurred during the observation period while exposed to drug and the outcome of the pregnancy are to be reported to Gilead DSPH using the pregnancy report form within 30 calendar days of becoming aware of the pregnancy

The following information is required to be collected and reported for this study. All pregnancies that occurred during the observation period while exposed to drug Viread[®] or Baraclude[®]:

- Information on all pregnancies
- The outcome of the pregnancy, including any premature termination (e.g., a spontaneous abortion, an induced therapeutic abortion due to complications or other medical reasons)

Timelines for reporting to Gilead are as follows:

- Within 30 calendar days of knowledge of the pregnancy
- Within 3 calendar days of knowledge of all pregnancy related serious events (regardless of causality, e.g., a spontaneous abortion, hospitalization, etc.)

Pregnancy information should only be reported on the paper pregnancy report form, and the outcome should be reported on pregnancy outcome report form. However, if the event qualifies as an SAE then an SAE form should be reported as described in Section 11.1.

Any premature termination of pregnancy (e.g., a spontaneous abortion, an induced therapeutic abortion due to complications or other medical reasons) or SAE occurring as an adverse pregnancy outcome post-study must be reported with the 3-calendar-days timelines.

11.2. Gilead Reporting Requirements to Regulatory Authorities

Gilead is responsible for analyzing reports of all safety information and reporting to regulatory agencies as determined by country-specific legislation or regulations.

Assessment of expectedness for all safety reports will be determined by Gilead using reference safety information specified in the European summary of product characteristics (SmPC) {Bristol-Myers Squibb Pharmaceutical Limited 2014} {Gilead Sciences Inc 2015}.

The section hereafter lists standard definitions for management and reporting of adverse events/adverse reactions, and provides timelines and modus of reporting for the selected safety information required to be collected and reported in this study.

11.3. Definitions

11.3.1. Adverse Events

An adverse event (AE) is any untoward medical occurrence in a clinical study subject administered a pharmaceutical product, which does not necessarily have a causal relationship with the treatment. An AE can therefore be any unfavourable and/or unintended sign, symptom, or disease temporally associated with the use of a medicinal product, whether or not considered related to the medicinal product. AEs may also include lack of efficacy, overdose, drug abuse/misuse reports, or occupational exposure. Preexisting events that increase in severity or change in nature during or as a consequence of participation in the clinical study will also be considered AEs.

An AE does not include the following:

- Medical or surgical procedures such as surgery, endoscopy, tooth extraction, and transfusion. The condition that led to the procedure may be an AE.
- Situations where an untoward medical occurrence has not occurred (e.g., hospitalization for elective surgery, social and/or convenience admissions).
- Any medical condition or clinically significant laboratory abnormality with an onset date before the first recorded date on which their creatinine clearance fell between 20-60 mL/min are considered to be preexisting conditions and should be documented on the medical history eCRF (if applicable).

11.3.2. Adverse Drug Reactions

An adverse drug reaction (ADR) is defined as an untoward medical occurrence (unintended or noxious responses) considered causally related to an investigational or approved medicinal product at any dose administered. Adverse reactions may arise from medication errors, uses outside what is foreseen in the protocol or prescribing information (off-label use), misuse and abuse of the product, overdose, or occupational exposure.

11.3.3. Serious Adverse Events

A serious adverse event (SAE) is defined as an event that, at any dose, results in the following:

- Death
- Life-threatening (Note: The term "life-threatening" in the definition of "serious" refers to an event in which the subject was at risk of death at the time of the event; it does not refer to an event that hypothetically might have caused death if it were more severe.)
- In-patient hospitalization or prolongation of existing hospitalization
- Persistent or significant disability/incapacity

- A congenital anomaly/birth defect
- A medically important event or reaction: such events may not be immediately life-threatening or result in death or hospitalization but may jeopardize the subject or may require intervention to prevent one of the other outcomes constituting SAEs. Medical and scientific judgment must be exercised to determine whether such an event is a reportable under expedited reporting rules. Examples of medically important events include intensive treatment in an emergency room or at home for allergic bronchospasm; blood dyscrasias or convulsions that do not result in hospitalization; and development of drug dependency or drug abuse. For the avoidance of doubt, infections resulting from contaminated medicinal product will be considered a medically important event and subject to expedited reporting requirements.

11.3.4. Serious Adverse Drug Reaction

A SADR is defined as any SAE that is considered causally related to the medicinal product at any dose administered.

11.3.5. Special Situations Reports

Special situation reports include reports of pregnancy; medication error, abuse, misuse, overdose, lack of effect; off-label use, product complaints and occupational exposure.

A pregnancy report is used to report any pregnancy that occurs during the study, whether or not maternal or paternal exposure to the product occurred.

Medication error is any unintentional error in the prescribing, dispensing, or administration of a medicinal product while in the control of the health care provider, subject, or consumer.

Abuse is defined as persistent or sporadic intentional excessive use of a medicinal product by a subject.

Misuse is defined as any intentional and inappropriate use of a medicinal product that is not in accordance with the protocol instructions or the local prescribing information.

An overdose is defined as an accidental or intentional administration of a quantity of a medicinal product given per administration or cumulatively which is above the maximum recommended dose as per protocol or in the product labelling (as it applies to the daily dose of the subject in question). In cases of a discrepancy in drug accountability, overdose will be established only when it is clear that the subject has taken the excess dose(s). Overdose cannot be established when the subject cannot account for the discrepancy except in cases in which the investigator has reason to suspect that the subject has taken the additional dose(s).

Lack of effect is defined as the failure of the expected or intended pharmacologic action or therapeutic effect as described in the pharmacology and/or indications section of the current product label.

Off-label use is defined as the intentional use of licensed medicinal product by a Health Care Professional for a medical purpose not in accordance with the authorized product information with respect to indication, dose, route of administration, or patient population (e.g., the elderly).

Product complaint is defined as complaints arising from potential deviations in the manufacture, packaging, or distribution of the medicinal product.

Occupational exposure is defined as exposure to a medicinal product as a result of one's professional or non-professional occupation.

11.3.6. Clinical Laboratory Abnormalities and Other Abnormal Assessments as Adverse Events or Serious Adverse Events

Laboratory abnormalities without clinical significance are not assessed as AEs or SAEs. However, laboratory abnormalities (e.g., clinical chemistry, hematology, and urinalysis) that require medical or surgical intervention or lead to drug interruption, modification, or discontinuation must be assessed as an AE, as well as an SAE, if applicable. In addition, laboratory or other abnormal assessments (e.g., electrocardiogram, x-rays, vital signs) that are associated with signs and/or symptoms must be assessed as an AE or SAE if they meet the definition of an AE or SAE as described in Section 11.3. If the laboratory abnormality is part of a syndrome, record the syndrome or diagnosis (e.g., anemia), not the laboratory result (i.e., decreased hemoglobin).

11.4. Assessment of Adverse Events and Serious Adverse Events

The investigator or qualified sub-investigator is responsible for assessing all fatal adverse events, renal AEs, renal SAEs, renal events of special interest, and ADRs and SADRs related to either Viread[®] or Baraclude[®] for causality and for final review and confirmation of accuracy of event information and assessments.

11.4.1. Assessment of Causality

The investigator or qualified subinvestigator is responsible for assessing the relationship to drug therapy using clinical judgment and the following considerations:

- No: Evidence exists that the AE has an etiology other than the drug. For SAEs, an alternative causality must be provided (e.g., preexisting condition, underlying disease, intercurrent illness, concomitant medication).
- **Yes**: There is a reasonable possibility that the event may have been caused by the medicinal product.

It should be emphasized that ineffective treatment should not be considered as causally related in the context of AE reporting.

In the context of this retrospective, non-interventional cohort study, relationship to Viread[®] or Baraclude[®] therapy should be clearly documented on the patient's eCRF and AE/SAE form.

12. PLANS FOR DISSEMINATING AND COMMUNICATING STUDY RESULTS

12.1. Study Report and Publications

A study publication will be prepared and provided to the European Medicines Agency (EMA). Gilead Sciences will follow the standards set out in the STROBE Guidelines for Strengthening the Reporting of Observational Studies in Epidemiology (STROBE) {von Elm et al 2008}. Gilead will submit publications to regulatory authorities within two weeks after first acceptance.

The final study report will be submitted to applicable authorities and review bodies within 6 months of study completion.

INVESTIGATOR STATEMENT

I have read the protocol, including all appendices, and I agree that it contains all necessary details for me and my staff to conduct this study as described. I will conduct this study as outlined herein and will make a reasonable effort to complete the study within the time designated.

I will provide all study personnel under my supervision copies of the protocol and access to all information provided by Gilead Sciences Europe Ltd. I will discuss this material with them to ensure that they are fully informed about the study.
